I think they were considering horns and low noise amps to get above 10 GHz.
I did a lot of analysis to figure out what was required, but never got to
finish it, on account of being laid-off! Nobody ever seems to want to spend
the money to get it right.

Had a quick look at HFTA

You need some kind of profile of the path you want to examine. I'd suggest you download 3dem and use its profile output function (draw a line and it graphs the result and makes an ASCII text file of the results) You can use SRTM data for input. This will give you 90m odd horiz resolution.

You'll be able to create an ASCII text file as outlined in the HFTA PDF manual page 2 - and use that for input.

I cant for the life of me remember the URL for 3dem but I remember you have to register an email address agaanst it. I dont think any spam was generated from it. If you get lost gimee a shout and I'll see if I can legally upload it to you - or I'll find the URL!

Go for it!

Cheers Bob

The question is about lab techniques and error measurement and
Richards post was in answer to that.
Another person insinuated that a person who
tests against a dipole and measures after a skip has taken place is in Lu
Lu land because he assumed he was literally describing a normal
lab test of comparing to a dipole!

Remember, Richard was replying to the initial post which was
very specific in nature regarding lab testing and degree of error !
Assumption has no part in a real laboratory.
>
> His tests were not intended to measure the gain of the antenna. They were

I could not agree more and stated so in my last post

> As you have correctly pointed out, in any environment except free space,
> that number is not the same as the antenna gain in dBd. Anybody who has
> thought about it is aware of the problem, and that clearly includes
> Richard.

Then why is he introducing dbi into the subject using Kraus as a backup?
Why does he state that TOA are "usually" the same when the opposite is true
especially when comparing a curtain to a dipole ? I don't believe that to be
correct
In the absence of denial by a guru must I assume he is correct or he meant
something else

and everybody knows what he said is true?

So you agree with the poster who stated that if a person thought that a
dipole comparison test consistes of comparing after skip took place,
is in Lu Lu land?

> Everybody agrees with you, so you can stop banging on that open door.
They do ....????

And the question regarding propagation and antenna function can we assume
he is correct on that also ? I don't like to "assume" that he meant
something different
and let the newbies as well as I to be lead astray.
Must I assume he is correct in that last sentence he made
where I am asking for a corroborating technical written statement ?
Richards last statment was /is an echo of a similar posting made a few
months ago and the Gurus said nothing to confirm or deny it's voracity?.
What are we meant to assume , that if a guru doesn't question it
it must be correct? I personally would rather see corrobaration
in a accepted technical writing than set up the beginnings of an old wives
tale
The old saying is still true , don't rely on one gurus answer, ask another
and then another and ensure that context is correct.
I await Richards response with interest so that I may read an authoritive
statement for myself without the need for "assumption" as to what he
"really"
meant to say but didn't. If you know what he "meant" to say on that last
remaining subject why not supply a helping hand ?

Art Unwin wrote:
"---may I go back to the "compared to a dipole" statement which Richard keeps brushing off."

I accept a resonant dipole reference as a given.

It is true that the antenna under test and the reference dipole have different radiation patterns. Our goal was to compare received signal strengths at locations of interest.

The assumption was that on average, the propaqgation was nearly the same for the signals received from both transmitting antennas. Good or bad propagation, the difference between the signals depended on gain in the direction of the receiver as the transmitted power was the same to both antennas no matter where it landed.

Kraus says on page 535 of his 3rd edition of "antennas":
"Suppose that we express the gain with respect to a single lambda/2 element as the reference antenna. Let the same power P be supplied to this antenna. Then assuming no heat losses, the current Io is the sq rt of the power divided by the resistance of the reference antenna.

In general, the gain in field intensity of an array over a reference antenna is given by the ratio of the field intensity from the array to the field intensity from the reference antenna when both are supplied with the same power P."

Kraus` example was our intended case.

Our expectations were met and our contractors were paid.

Best regards, Richard Harrison, KB5WZI

Good point, although in the case of highly sophisticated CPUs (superscalar, VLIW, etc.), the difficulty in getting all the cache and register access scheduling optimal is difficult enough that there are typically very few people who can consistently do better in assembly than a high level language with an optimizer.

In many cases selecting a better algorithm might buy one a lot more!

"Propagation" has to include ALL means by which EM energy radiated from a wire antenna finally arrives at a receiving location. That necessarily includes the radiation effects of reflecting/obstructing objects and surfaces, each of which may be illuminated by varying ERP from the wire antenna -- depending on the radiation envelope of the wire antenna itself, its installation detail, and site topology.

The ERP directed toward a particular receiving site depends on more than the free space gain of the tx antenna along a single launch angle (which I believe is Art's point).

Art Unwin wrote:
"Remember, Richard was replying to the initial post which was very specific in nature regarding lab testing and degree of error."

Antenna test facilities involve far fields. Kraus says on page 831 of his 3rd edition of "Antennas":
"---it is obvious that measurement usually takes place in the far field."

This can be far indeed with highly directive antennas.

My initial response included:
"A lab may put its stamp of approval on your instrument, but your best assurance may be measurement of known values. The termperature of ice-water or the voltage of new dry cells, for example. You usually can try several dry cells for confirmation or averaging.

In antennas, one strategy for successful gain determination is comparison with an antenna of known gain."

My posting was imperfect. There`s nothing that can`t be improved, but were I re-writing my posting, I can`t think how I might improve it.

I don`t think my example of checking gain of an array using skywaves was amiss. We build shortwave antennas to use skywaves. We give antenna gains in free-space because it makes sense.

I said we built a small-scale model first because we can measure the model`s characteristics without a helicopter. The full-scale antenna performed exactly like the model. Computer modeling has eliminated the small-scale model step in new designs.

We checked only the first off of the new design, with the full confidence that subsequent antennas of the same design would perform the same.

Of the first antenna, we measured everything including the currents along each element. We used an R-F ammeter in a loop suspended from the element and towed along with a string. We read it using a telescope. The antenna was a scientific success as well as a practical success. This differs from some of the oil wells I was to drill later, though some of those succeeded too.

I can only post what I know and it will never satisfy what everybody wants to read. Sometimes my postings are more responsive than others. That`s part of the fun.

Best regards, Richard Harrison, KB5WZI

Richard,
You are at it again, avoiding the supply of corroberation to what you say
is true.
Stick to the basic statement that you made, which from their silence, the
gurus concur
with.
Your statement was that:
propagation is what determines TOA
and I ask for confirmation of the correctness of that
statement from you in the nature of some written text.
The gurus obviously accept your statement as fact, but I do not.
Usually you refer to a text to back up your statement ,but this time you
haven't, winging it
and relying solely on the fact that the gurus agree with you.
Surely you or some guru can come up
with a written text that states that propagation is what determine TOA.!
That is what this group is all about where gurus debunk the untruths
and supply the real truths and not to let old wives tale dominate.
You also stated that you made the ":assumption" presumably
based on the "facts" stated above that the Curtain could be considered as
similar to the dipole
since propagation determines that they are the same. This is total junk ,in
its entirety,
unless you or the gurus can come up with a written text that confirmes their
positions.
Art

I wouldn't call them dogs, but you do have to appreciate that you are operating on an extremely short antenna...

I use Iron Horse hamsticks on my mobile. I routinely operate on 40m (daily net in the Hawaiian Islands on 7.088) and get great reports all of the time. Have also had contacts from mainland on 40m on occasion. I use the sticks with an "extended bumper mount" that is bolted to the trailer hitch mount and hangs out on the left side of the truck just ahead of the bumper. To raise the mount point of the hamstick, I have a chunk of pipe with 3/8 bolt hardware that bolts to the mount, a 4 inch spring on top of that, and the hamstick mounted to the spring. It lengthens the antenna about 18" or so, and the by product has been a lower SWR and wider bandwidth for all bands I've used.

I can't say that I do as well on 75m, but it is usable at least in the Hawaiian Islands (I'm on the south end of the Big Island, so Kauai is the farthest from me, roughly north. Oahu is just below (south) of Kauai.)

Thanks

1432. advice needed as to G5RV 160m use

Newsgroup: rec.radio.amateur.antenna
Date: 2005-04-26 18:22:46 UTC
From: RB <rbig@bellsouth.nospam.net>
Message-ID: <TAvbe.131319$UW6.7534@bignews5.bellsouth.net>
Source record: 78447

I am using the MFJ G5RV, and have a coil of coax for balun purposes between the ladderline and coax to the shack. My G5RV works fine.

Now, I'm starting to think about using it on 160m, as the MFJ instructions say I should be able to do---with a bit of monkeying around.

MFJ says the G5RV, when configured as a single wire fed horizontal antenna, acts a Marconi type of top loaded vertical.

Specifically, the instructions give me two options for 160M use. One is to feed one side of the coax at my shack with a single wire to the tuner, and ground the other side of the coax to a good earth ground or counterpoise. I have no idea what this becomes in this mode.

The other option is to connect the coax outer conductor to the inner one, and feed both with a single wire from the tuner, using a good earth ground or counterpoise to the rig.

A question is what the consensus is as to which of the above feeds would be the better?

I could remove the balun, and then feed one side of the antenna hot, with the other side going to ground and/or counterpoise. Again, what would this be?

The other question is whether or not I'd be better off with two long (maybe 100') counterpoise runs in opposite directions, as opposed to a good earth ground only?

Help appreciated.

1433. Re: Accuracy of Antenna Testing Ranges

Newsgroup: rec.radio.amateur.antenna

Message-ID: <116t1ras6o6vh48@corp.supernews.com>
Source record: 78448

"Takeoff angle" can have two meanings. The first, and really a misuse of the term, is the one used by antenna modeling programs such as EZNEC. It means the elevation angle at which an antenna's radiation is maximum. This is a property of the antenna and its local environment (particularly the height above ground for horizontal antennas, and local ground quality for vertical antennas).

The second meaning is the elevation angle at which propagation occurs. This is dictated mainly by the propagation path -- the distance and the effective height of the ionosphere. The antenna pattern can play a role only when more than one path is possible, for example single and double hop, by modifying the amount which propagates by each path. The "takeoff angle" of the first meaning (angle at which the radiaion is maximum) isn't a particularly useful measure of and antenna's performance, and it certainly doesn't determine the real "takeoff angle" of the second meaning (angle at which propagation occurs).

Art has used "takeoff angle" of the first meaning liberally in his writings, often with the added and incorrect implication that all the radiation from an antenna occurs at its "takeoff angle", with none at other elevation angles. So his confusion about Richard's statement (which correctly used "takeoff angle" in the second sense) is understandable.

Art Unwin wrote:
"Surely you or some guru can come up with written text that states that propagation is what determines TOA."

I don`t find TOA in any index. I find "elevation angle", which I suppose is a synonym, in my 19th edition of The ARRL Antenna Book. On page 2-9 it says:
"The elevation angle is referenced to the horizon at the earth`s surface , where the elevation angle is 0-degrees."

On page 3-5, the same book says:
"Now look at Fig. 4A, which compares the computed vertical-angle response for two half-wave dipoles at 14 MHz."

The Antenna Book is not very definitive.

"Transmission Lines, Antennas, and Wave Guides" on page 314 says:
In order to escape from the earth without excessive ground attenuation, a sky wave must leave the earth at an angle of at least 3-degrees above the horizon.---At 3-degrees elevation, the distance per hop is about 3,500 km (2,100 miles). Longer distances are automatically broken up into units not exceeding 3.500 knm."

It`s the medium breaking up the hops, not the antenna.

Best regards, Richard Harrison, KB5WZI

A question is what the consensus is as to which of the above feeds would be
the better?

Easiest way to find out is to try them. It depends on the path used, but overall, I'd probably put my money on the "T" vertical setup being the best. Neither just the ground, or the two radials are gonna be dx busters, but they will work well enough to get on the air. If you run it as
a dipole, the ground isn't much of an issue. But as a T vertical, it is...

I think that the drawning is clear enough.
As you have queries, though, let me explain.
Well, about the feedpoint, refer to the link I gave you:

"The source (=feedpoint) lies on the origin of the axes
and is represented by an arrow."

As for your second question,
the black dots on the drawing,
represent connections between the dipoles.

I wish this was helpful...
I want to thank you and I'm waiting for your comments.

>
> Perhaps it is time to check in and see if you have your answer yet
> Reg.

==========

Wes,
Not everybody has yet taken a punch at it. There are several regular names who are missing.

All I want is a number, eg., of decibels, preferably from a standards lab.

But it has only been been demonstrated "Measurements" is not a "Science" - it is an "Art". Perhaps I can clarify my question.

Suppose a customer, perhaps an antenna manufacturer, walks into the lab wheeling behind him a weird contraption (we've heard of them) and asks for the forward and reverse gains to be determined and for a calibration certificate to be issued.

For present purposes actual forward and reverse figures don't matter.

But for the two figures to be of value the uncertainties in the determination should be stated on the certificate (a legal document).

What are TYPICAL uncertainties, in dB, which appear above the Head of the Laboratory's signature.

A laboratory or ex-member should be able to put me in the right ballpark even if it is only for one typical case. For TRUE antenna performance measurements the best source of information is from a standards lab. There is no incentive to overstate performance. If discovered, exaggeration of a laboratory's capabilities results in loss of reputation.

In the UK, Standards Laboratories were regularly monitored for performance by the National Physical Laboratory (NPL), in effect Government controlled. I have been out of touch for 20 years with what happens these days.

In the 1970's I was a Government Approved Head of Laboratory. I personally set up the lab from scratch begining with a 30 x 40 feet empty room. All our own standards were traceable directly to the National Measurement Standards at the NPL.

An offshoot of the lab, also under my control, was a central calibration service for instruments used nationally by field engineers

for investigation of radio interference complaints by the general public and other parties. Many of the instruments were of Eddystone manufacture whose factory was in Birmingham a few miles from the Standards Lab. In between Eddystone's works and the lab lay B'ham University from which the very first 3000 Mhz magnetron appeared during the WW2 air raids on the city. Just in time to defeat the U-Boats which were sinking a 10,000 ton cargo ship every day in the horrible Battle of the North Atlantic. More than 100,000 merchant seamen and suicidal iron-cross submarine crews still lie sleeping in Davy Jones' vast locker.

That's quite enough variation for one paragraph. To return to normal -

Although we had a small screened room to calibrate RFI instruments, the laboratory's capabilities did not include measurement of antenna gains and losses. Hence my modern enquiry about uncertainties.

Note: Uncertainties are best considered because they arise from a multplicity of sources. Therefore they accumulate arithmetically - whereas accuracies do not and are more inconvenient!

Reg, G4FGQ. Alias Brer Rabbit or Punchinello.

I understand that the latter technique was quite commonly used. A
block of paraffin (available at many grocery stores for use in the
canning of vegetables), a large double boiler (electric heat preferred
over gas, I believe?), a bunch of dowels cut to size and end-notched
and drilled for twist-ties, and a few minutes of soaking in the molten
paraffin. This should impregnate the pores in the wood and do a
pretty good job of water-proofing the spreaders.

A more modern approach (perhaps more convenient but I'm not sure it's
any better electrically) is to apply two or three good coats of spar
varnish or outdoor-rated polyurethane to the spreaders after notching
and drilling. Diluting the first coat by about 30% with mineral
spirits may aid penetration and improve the seal; sanding between
coats may be required for proper adhesion.

And I thank very much for the above statement to which I fully agree.
But later you turn away from that statement with respect to the
propagation conditions do you not?

>
> The second meaning is the elevation angle at which propagation occurs.
> This is dictated mainly by the propagation path -- the distance and the
> effective height of the ionosphere. The antenna pattern can play a role
> only when more than one path is possible, for example single and double
> hop, by modifying the amount which propagates by each path.he environment

Now Roy I have a problem with what you are saying here
I spend hours modelling an array to lower the TOA or angle of max radiation
which directly controls the main lobe dimension both in width and height.
I model an antenna array such that it emulates in a way a "stacked"
array where as low as a 9/10 degree TOA. The 3 db gain window is broader in
width and narrower
in height than say the normal array. It is this "TOA" that determines what
window we have and
where it hits the ionesphere which thus determines its point of arrival on
the earths surface
Not propagation which is the "environment" of all antenners in the vicinity
and the same
for all antennas at a particular time.
The ARRL clearly shows that it is the TOA that determines the range as it
were of one antenna
comparered to the others with different TOA.. For the life of me I cannot
concurr with the statement
as stated.
I would also add that a antenna with a lower TOA invarably means a thinner
lobe of radiation
as well as a lower 3dB window and in a few cases the underside contour of
the main lobe can
be lower than one of equivalent gain. I use the term TOA as being the line
of maximum gain
In no way do I infer that we have laser type radiation as compared with a

flashlight style radiation

The "takeoff
> angle" of the first meaning (angle at which the radiaion is maximum) isn't
> a particularly useful measure of and antenna's performance, and it
> certainly doesn't determine the real "takeoff angle" of the second meaning
> (angle at which propagation occurs).

Then it is here that that we are entangled. I agree the envionment
can affect or deflect radiation, whether it be a mountain face or the
down slope of a mountain, but I do not see how existing propagation
can mold the direction of such radiation, and possibly it is here
that my learning curve can be bettered . To me, propagation affects
first come into being when the ionesphere is able to" turn" or "deflect"
radiation according to the relative angle of impact of that which it turns
and not before. (when all is said and done this is the crux of the debate)

>
> Art has used "takeoff angle" of the first meaning liberally in his
> writings, often with the added and incorrect implication that all the
> radiation from an antenna occurs at its "takeoff angle", with none at
> other elevation angles. So his confusion about Richard's statement (which
> correctly used "takeoff angle" in the second sense) is understandable.

No,
That is not true. My experimentation is aimed at arriving at a low
TOA for an antenna. The reason is two fold

"1" A lower TOA usually means that the upper half of the main lobe is
reduced
and the lower half of the lobe is not reduced. Thus radiation is
contained
within an angle of radiation that is usefull and not wasted as it is with an
antenna of a higher
TOA.

"2" When the attributes of "1" above are achieved it is then possible to
LOWER the underside
of the main lobe contour where one can communicate at lower angles with a
single feed array
and obtain the advantages of multi stacked arrays with multi feed point.

Is this the error of my ways where any change I make to an antennas pattern
is rendered of no use because I must first find a way to manipulate
propagation
where all the action is really at?

I also want to make it clear that I appreciate your post which I see as an
attempt to clarify matters
that are presently being discussed ie.It is propagation and not the antenna
that determines the
TOA. Or "antenna pattern is determined by propagation" so that we don't
get hung up

on the term TOA
Very best regards
Art

>A question is what the consensus is as to which of the above feeds would be
>the better?

The second is the more commonly-recommended approach, I believe. As I
understand it, you end up with a vertical radiator (the coax braid),
top-loaded with a big capacity hat (the G5RV proper), working against
your counterpoise wire or radials (or against just a ground stake,
which probably won't give great results due to high ground losses).

I'm rather sceptical of the first approach. If your rig is properly
RF-grounded, this approach seems little different than trying to feed
the coax directly from your tuner, except that you'll have some length
of the ground-return current coming back to your rig via its grounding
strap/wire rather than inside the coax. You're going to be trying to
drive a short horizontal antenna (low radiation resistance, in series
with a high capacitive reactance) through coax... a recipe for a very
high SWR and high losses. You may be able to get it to tune up, if
your external transmatch is a capable one, but your on-the-air
efficiency is likely to suffer badly.

If your rig isn't RF-grounded, you've got other problems with the
first arrangement :-(

O.K. Richard I'll leave it at that with you . You continue to send
prewritten responses to questions that were not asked.or do not pertain to
the subject at hand
I will leave it to you to alert all antenna labs not to test antennas when
there is no
propagation or, failing that, leave a bucket under the antenna to compensate
for the lack of TOA
or elevation angle because of the lack of propagation generated modifying
actions..
I don't know that if they leave the door open during testing it will
suffice.
You can always supply a written technical text to justify youir actions when
you find it.

Convenient (non-weatherproof) connectors are available for humble, TV-style, 300 Ohm twinlead. But I am not aware of any sort of connectors for 450 Ohm window line.

Does anyone in this NG know of any such connector? If yes, where can they be purchased? And if not, how about clever work-arounds--perhaps doing something with banana plugs?

Thanks and 73,

Ed

And, as I've said quite a few times in one way or another, it's largely
a waste of time.

> the earths surface

That's absolutely incorrect. All antennas radiate at all angles. The
ionosphere doesn't know or care at what angle your antenna is radiating
the most -- propagation will occur at the angle favored by the
ionosphere at the time. Your antenna's pattern doesn't dictate the
geometry of the path.

> Not propagation which is the "environment" of all antenners in the vicinity

> as stated.

By speaking of "environment" I was not including propagation, and in
conforming to traditional usage, I also don't include propagation when
speaking of antenna patterns. An antenna pattern is a polar plot of the
field intensity of the antenna at a distant point, but with the
assumption that the propagation to all points is lossless. The actual
signal received at a distant point requires the inclusion of propagation
effects. The pattern is one element in the equation, but only one.

> where all the action is really at?
>. . .

Close. Sometimes two or more propagation modes are possible, such as single and double hop. From here to say, New York, I might have single hop at 3 degrees and double hop at 12. (Please forgive me if those particular propagation angles can't really occur at the same time, but they're in the ballpark.) It doesn't matter one iota what the angle of maximum radiation from my antenna is. All that matters is the gain or field strength at elevation angles of 3 and 12 degrees. All the rest of the radiation will go some place besides New York. As a general rule, I can get a stronger signal to New York with X dBi at 3 degrees than the same gain at 12, because the single hop path loss is usually less. So it might pay me to maximize my gain at that angle at the expense of 12 degrees. On the other hand, the other station's antenna pattern is just as important -- if it has a lot more gain at 12 degrees than 3, he might not hear me if I put out most of my energy at 3 rather than 12. But in any case, it doesn't matter how much I'm radiating at 1, 5, 7, or 15 degrees, or what my antenna's maximum angle is. All that counts is how much I'm radiating at 3 or 12 degrees. Other than manipulating your antenna to radiate more or less at those two angles, you don't get to "manipulate propagation" to support other angles at a given time, frequency, and path. You're stuck with those until the ionosphere changes. Knowledgeable DXers (which I'm not) spend a lot of time working out what the angles will be for propagation to various target locations, and how to design, build, and switch antennas to maximize the amount of radiation at those angles.

> on the term TOA

No, antenna pattern isn't determined by propagation. The signal strength at the other end of the path is determined by the gains of both the transmit and receive antennas at the elevation angle of propagation, and the loss along the path. Period. Notice that "takeoff angle" and "pattern" didn't appear in that sentence. And you don't get to choose the angle of propagation (unless more than one are supported at a given time, which is only sometimes true, and then you can only choose between the supported angles).

I suggest downloading the excellent, free, and easy to use propagation software by Shel Shallon, W6EL, http://www.qsl.net/w6elprop/. In a few minutes, you'll be able to see what angles are supported at a given time and frequency for a given path.

It is up to the user to design the antenna with the pattern of choice
and that is what I did. And you can do it to since you are familiar
with antenna programs. You just have to point the initial program so it
is able to spot what dimensions are required to produce the required
pattern.
Roy please go back to the top and answer that simple one word question
and let it all hang out

I use the Radio Shack banana plugs. They're heavy duty. Have a male
plug at one end, a female jack at the other end. Attach the ladderline
wire with the built-in thumb screws. The double banana RS connectors
are the same width as 450 ohm ladderline. As I understand, they're
patterned after the old General Radio banana plugs, which are no
longer available.

See part 278-308 at the RS site.

Hi Joel,

Almost every performance gain you describe is hardware limited - not
software limited. If you can conspire to make every reference call a
cache hit, you win, but 99.999% of the applications used by everyone
here (including antenna modeling) fail in that one regard and stumble
over the rest of the "optimizations." When I look at my performance
monitor, it is idling along at 0 to 2% usage as I type (no surprise).

When I pull up a page from the New York Times (before I set my
firewall filters to turn off advertising) it would peg at 100% ad
infinitum (I guess there's an ironic pun in that). I dare say that no
one is using optimized code for running Nike ads - or if they are,
that it makes any appreciable difference at 2GHz (with a memory access
running at, what, 10% of that?). What HAS been optimized is the data
compression schemes that make up for sloppy code (the problem is
undoubtedly a memory leak or a failed garbage collection routine).

In a sense, I used client side optimization to kill the advertising
stream.

The Pomona MDP series is similar, but uses an internal setscrew rather
than a thumbscrew. Digi-Key sells the Pomona plugs with nickel-plated
brass contacts for $2.47 in onesies, quite a bit less than the $6.29
gold-plated Radio Shack versions. Pomona does make gold-plated models
but Digi-Key doesn't carry them.

Richard, why don't you just say that the angle of elevation of the radio path has nothing whatsoever to do with the type of transmitting and receiving antennas, or the directions in which they may be pointing or elevated, or even the operating frequency.

When communication has been established between A and B, the angle of elevation depends only on the locations of A and B on the Earth's surface, on the number of hops, on the height of the ionospheric layers, and on the slope of the layers.

The elevation angle is determined purely by trigonometry.

It tends to be the same at both A and B. There may be simultaneously more than one path and therefore more than one angle. In which case multi-path distortion and fading occurs.

Received signal strength depends on the two antenna gains in the direction of the path. The take-off angle predicted by Eznec-type programs is an altogether different thing. It depends on reflections from the ground in the vicinity of the two antennas. It does however have an effect on received signal strength but is of use only when the locations of A and B and all other geographic and ionospheric variables are known. They seldom are! As are ground conditions.

Reg, G4FGQ.

If the output pins are isolated from each other and from
the chassis, you can series the power supplies. If the
chassis is connected to the common lead, you can't.

Think batteries. You can generally series two batteries
unless both negatives are tied to the vehicle chassis.

Art, propagation does indeed determine the takeoff angle. Let's call that pTOA. An antenna also has a design takeoff angle. We will call that aTOA.

I think you may be using the term applied to an antenna, Don't confuse it with pTOA. two different animals with the same name.

Way back years ago, back when men were men, when DOS was unheard of, and AM was king, the thing to do was to get a big ol' slab of paraffin and a double boiler. Melt the paraffin in the double boiler and boil the wooden dowels in the paraffin. The dowels absorbed the wax and became (somewhat) waterproof after which they could be used as spacers.

O.K. Roy let's get down to the nitty gritty and look at this question.
Your background in antenna programs makes you a person of choice
to declare if what I do is a waste of time and where I must default to an
experts judgement.
A month or so ago I gave a description of the antenna that I modelled
and for your interest I used the AOP program by Beasely a person
that you have collaborated with in the past.
One can design a yagi antenna with 8 elements say on a 60 foot boom
and then note the gain and the elevation angle of maximum gain.
This can be done using the most basic antenna program available.

The next step is to apply this same antenna to a program that is capable
of changing dimensions to obtain a desired function ,which in this case can
be
"Gain". There is reference to a NEC program on this group during the past
week
or so that I believe is capable of doing this, that is on the web and also
free to all.
With the use of variable dimensions which includes best x,y and Z positions
for various pulses or physical positions the program will procede to do as
asked.

This test is about as simple as it gets to show how the angle of max
radiation can be changed
as well as the envelope of the new angle range to achieve a 3 dB window of
radiation

You will see that the computor program will immediately remove itself
from a Yagi design to obtain a better gain and form an array that consists
of one driven element and where the rest are all reflectors!
Though the final shape appears to represent a dish it is not, it is simply a
design with multiple dimentional reflectors in the best coupling mode.
The result is a gain figure that will exceed the original design,

which is what we requested of the program i.e.allow it to make changes of
choice
to achieve a higher gain than the initial yagi design
With the above. one can change the elevation angle for maximum gain which
has now
dropped to a 11 to 10 degrees or even 9 degrees if one is willing to
sacrifice some gain.
This can be also be achieved by allowing the driven element to deviate from
a straight dipole
to a vee shape tipped in such away to helps control reactance swings of the
total array.
The above is quite simple to duplicate, where anybody can place a 8 element
yagi with a long boom
of 60 ft placed over real ground and challenge the program to devise a way
of increasing gain.
In my case the program changes to a non director mode without any prodding,
other programs
may well need some prodding. Changes to elevation for maximum gain will
change automatically
and one can expect to easily devise an array with a 10 degree angle where a
gain of 16 dbi is attained
as well as a broader lobe than can not be accomplished with a Yagi design.
If you find that you cannot repeat the above results in a short space of
time then it surely reflects
a misuse of programs on my part.
Please note that propagation has no part in forming the shape of the main
lobe to the
best of my understanding but you would know better than most as to what the
program parameters actually are
I look forward to your response or any other program users response that
shows my findings
are a waste of time so I can direct my experimentation in a more fruitfull
direction.
Best regards

Dear "superas-1988" (presumably in Greece)
It appears from the drawing that the antenna is a wire antenna with all wires in the Y-Z plane. It is likely that the portion above the driven dipole is a mirror image of the portion below the driven dipole. Each dipole has the same length and that length is specified as 0.5 WL.
Questions:
1. Is the above true?
2. What is the included angle between the driven dipole and the dipole to its right and above? It looks as if that angle is near 55 degrees.
3. Is the length of each dipole a physical 0.5 WL or an electrical 0.5 WL?
4. What is the nature of your interest? A school project? A radio amateur's project?
5. Is the antenna intended to be used at HF? If so, how high do you consider the driven element to be above the earth's surface?

Regards, Mac N8TT

Because "takeoff angle" as you use the term does not bear a direct
relationship to the ability to communicate.

Roy

The Canadian with 2 calls, VE3GK/VE2GK, Gerry King, made a very nice 20 meter antenna system, which he gave a great talk about at our local hamfest in northern NY back around 1978 +-. This system was unique, at least then, in that he had 2 20 meter beams that could be used singly, upper or lower, or as a stack, and could independently vary their heights. He reported very good success, since he could vary the angle of greatest radiation at will.

He is now a silent key, unfortunately, but his site is still up. I will leave it to those interested to find it, it's not hard, but his heirs don't need useless traffic. I am not sure if his old system is pictured on the page.

Reg, G4FGQ wrote:
"Richard, why don`t you just say that the angle of elevation of the radio path has nothing whatsoever to do with the type of transmitting and receiving antennas or the directions in which they may be pointing or elevated, or even the operating frequency."

Confuse the readers?

Geometry and trigonometry are involved. What`s more, the signal may take more than one path between only two points, or multiple hops, or multiple azimuths. This causes fading and distortion.

Transmitted energy in directions other than to a receiver is wasted. That`s one of several reasons to use antenna directivity in azimuth and elevation.

Maybe Cecil`s IEEE Dictionary defines TOA. The references I`ve found are to "elevation angle" above the horizon.

In general, an antenna`s angle of maximum response is lowered by raising the antenna height. If you have stacked horizontal elements you can adjust their phasing to skew the elevation angle up or down some.

An ideal HF antenna may be a giant array of dishes that might be aimed for one-hop, if possible, in a multiple diversity system.

Something almost as good is a triple diversity system which uses rhombics. 3 receiving rhombics are plavced with about 10-wavelengths of lateral spacing at the lowest frequency received. Multicouplers on each rhombic feed various receivers , often at various frequencies. Diversity combiners select the best received signal of three carrying the same program. The results are spectacular. We used such TDR systems for broadcast program relay. Often the quality was as if the program arrived by cable.

Best regards, Richard Harrison, KB5WZI

There's no reason why the SWR should not improve when the line gets
wet.

On 50 percent of occasions it probably does.

In which case it is probably not noticed.

Richard Clark says -
> Hi Reg,
> I thought Wes' link was quite specific to the matter:
==========

Hi Richard,
I originally wrote -

"Does anyone have typical examples of measurement uncertainties
claimed
by antenna testing stations? Answers in decibels please."

The two links to papers, kindly found by Wes, are both devoted to microwave horns and dishes. Very interesting and directly related to the subject.

But in anticipation of the sort of replies I would receive, and in fact did receive, I specifically asked -

"A reply from a testing station, at HF or VHF, would be specially appreciated."

It appears that at microwaves a worst-case uncertainty of 0.2 dB, that is a range of nearly half dB, is achievable in the National Physical Laboratory at Teddington on Thames, London. Which is a little hard for an Old Timer like me to believe. But at HF and VHF, at which amateurs are mostly interested, the uncertainty on a typical open-air range is sure to be greater. If only because great accuracy of rocket technology at the lower frequencies is not needed.

It nearly always occurs that technical enquries at LF and HF get lost in the elevated mysteries of microwaves, circulators and scattering-parameters.

I am unfamiliar with precision antenna test and measurement methods. I don't particularly wish to know. But if you, as an employee of a reputable laboratory, were given the job of determining the forward and reverse gains of fractal or other weird antennas, at 7 MHz and 144 MHz, what uncertainties would you state? I'd believe you.

Reg, G4FGQ.

Right on.

Let's look at it this way. If I have an antenna with a "pencil beam"
and it's pointing at 90 degree azimuth and the station I want to
communicate with is at 0 degrees, I don't know of anyone who would say
that this is an optimum situation.

Yet, many (okay, one) would say that an antenna with (pardon me) a
"take off angle" of 3 degrees is *always* superior to one with a TOA
of 20 degrees, notwithstanding the fact that the desired station's
signal is maximum at 20 degrees.

This is like saying that I have room for a rhombic pointed at Asia so
I'm going to work my ass off optimizing it when all of the stations I
want to work are in Europe.

Why is this so? I'm completely baffled.

O.K. Roy if you are going to let this discussion revolve solely around the
term
of TOA which is a datum line around which the main lobe evolves,, A term you
have voiced
opposition to over the years and which you personally use in your own
antenna program design
then you will be succesfull in any debate regarding antennas. I have stated
many times that the
elevation angle denotes the line of maximum gain and the lobe that surrounds
this angle denotes
the area of communication ability represented by the oft used term of the 3
dB window.
You are refusing to accept the use of this term because of personal
emotional reasons,
that you only use the term under protest because of commercial reasons and
now as a basis for rejecting.
new knoweledge supplied by computor programs.,. presumably by clinging to
"all is known" mantra
I will never persuade you to view this thread with an open mind.

You have stated that TOA as I describe the term does not bear a direct
"relationship "
to the ability to communicate which obviously must relate to a part of a
post where you
envision that you have accomplished a "gottcha".
One person stated that everybody knows that I am right which I question,
especially
since you have now come forward with contrary thoughts.
Roy, there can be no debate if one must always accept
all your statements in Pope like fashion that excludes discussion.
Best regards
Art

I believe "takeoff angle" is in the same category as "capture area" and "S-unit" -- terms which nobody except amateurs seem to need.

No that is not what it is all about. Some here object to the term of TOA and
want strict adherence to the description in terms of "elevation angle".
This same subject came up a few months ago and went on for a long time.
Now we are at it again and allowing the discussion to supplant original
thoughts.
You can now see that somebody has inventing a statement
in straw man fashion and then using the lie as a truthful fact
for the basis of an illicit attack.
Anything goes
I'll wager if you look up the thread of a few months ago
on a TOA thread you will see contrary postings by the same persons
that are posting now, this purely for the sake of a continueing augument.
This group will never agree to anything other than all is known about
antennas
and will fight to the death if anybody alludes to anything that conflicts
with this.
It is for that reason the debate has been throttled and why TOA as shown in
some
computor programs is used as a diversionary tactic.

I give up !

The world is flat.
I will not disagree with that statement anymore
so that emotions can now settle down and I can live in peace

In addition:
All is really known about antennas since there is no evidence
of a scientific book that has been written about what is unknown
about antennas.

In addition :
I urge all newcomers to the hobby to accept the notion
that propagation can modify radiation immediately after emmission
from a radiating antenna , this being a consensus of viewa by noted
Gurus in the hobby

In addition
If a commercial computor program uses the term of TOA
then it is not to be trusted aince it is based around terms
that are known to be invalid and it must be left to the user
to determine how far this invalidity extends with respect
to results obtained. Many commercial programs use this
same term so it is a case of buyer beware.

Best regards
Art

wrote:

>I believe "takeoff angle" is in the same category as "capture area" and
>"S-unit" -- terms which nobody except amateurs seem to need.

Hmmm,

Capture area of antennas, 899, 927 of Terman's "Electronic and Radio
Engineering. The 899 reference appeals to aperture. The 927
reference gives a value of 1.5 or 0.12 lambdaï¿½ (also called intercept
area or antenna cross section) for a common dipole.

Using the co-equivalent aperture, from "Fields and Waves...," Ramo et
al., 581, 607-623. The 581 reference is to using reflectors and
lenses. The section length treatment relates to literal openings
masking a source of radiation.

Capture area, 255, 298-301, 495-496 from "TV and Other Receiving
Antennas," Bailey - which basically reduces a standard half wave
antenna's area to being one half wave long by one quarter wave in
width. When we look at the math offered in a later chapter (pg 299)
it reduces to 0.12 lambdaï¿½ a figure already described by Terman. "As
we said before, the use of discrete boundaries is a matter of
practical convenience." However, Bailey offers a treat in presenting
the "capture area" of Arrays of various sizes:
elements Area (lambdaï¿½)
1 .125
2 .25
4 0.5
and so on (naively presuming a 3 dB gain with each doubling of
elements).

As these first three draws off the library shelf have companions on
the same shelf with similar coverage, further examples would be
redundant.

The terms of S-Unit and Take-off angle are more an issue of
researching commercial and retail sources than academia. There is
some element of elitism in this; but having found that there are
volumes of instruction to be found in the commercial world that are
barely revealed in the ivory towers, I am not necessarily impressed
with sterile pedigrees (the IEEE dictionary is a monument of
impotence).

The errors remain across all applications, only the assigned values
change. If I arbitrarily scaled all values by 25, few could challenge
the numbers.

At 7MHz we can all agree that the errors are going to be inversely
proportional to the astronomical cost to determine. No one is going
to perform it at HF when they can only afford 1/100th scale models
that offer the accuracies implied above. What would spending more
money buy them anyway?

Or even the existence of the human race and their radio transmitters.
The propagation paths are still there, and even if we had never invented
radio they would still exist.

Antenna engineering is all about making the best use of the propagation
paths that Nature provides [*].

That basic fact should be "bleedin' obvious".

[*] The HAARP project does aim to change the ionosphere itself - but the
colossal size and power of HAARP only goes to show that "the rest of us"
can NOT do that. We cannot change propagation; we can only use it.

A handy phrase that hasn't been mentioned yet is "ray tracing". That is
what we're doing, same as in optics.

>Received signal strength depends on the two antenna gains in the
>direction of the path. The take-off angle predicted by Eznec-type
>programs is an altogether different thing.

Hmm... at the risk of proliferating TLAs, how about making a fresh start
and calling that the antenna's BVA - Best Vertical Angle?

BVA belongs to the antenna, and TOA belongs to the propagation path.

It doesn't get around the fact that the antenna radiates something at
all vertical angles, but it's better than the present situation of
(mis)using TOA for two different things.

Hi Tom,

Standard microphones (I am being quite specific in terminology here)?

I googled with the terms
B&K microphone reciprocity
and the first hit looks as good as any:
http://www.bksv.com/pdf/Bv0051.pdf
As a treat, it offers a discussion of matching with transmission line
metaphors.

I should point out that reciprocity means exactly that! The
microphone should be capable as acting as a loudspeaker (certainly not
too loud) when driven. Standard microphones are capable of accuracies
in the 1/100ths of a dB (and this is an extremely conservative
statement). If you are playing with retail microphones, and follow
the math, you should be able to cobble up something to the nearest
1/4th dB.

If your application conforms to this discussion, you may visit the
Brï¿½el & Kjï¿½r website to find deeper references. They are the
pre-eminent makers of precision sound equipment. As I pointed out in
another posting relating to the poverty of academia on many technical
subjects, the commercial field often leads the way in actual
instruction.

Hi Tom,

As a second thought, you may not be in the market for the reciprocity technique (it does require that you have a true reference microphone).

In that case, you would fall back to a Piston Phone and do a single point calibration. The method is as old as the hills, the math is extremely simple volumetrics, but the implementation (construction of the calibration unit) is not something for the faint of heart. You will need a precision lathe. Again, google using Brï¿½el & Kjï¿½r as a jump-off point.

Once you do the single point calibration, then you can proceed to a swept frequency analysis. Unfortunately this returns us to the necessity of a reference microphone. However, as relative frequency response is more available (from expensive retail models), you might have a chance.

Hello:

Now that Spring has arrived I am getting the urge to rebuild and/or
add antennae to my backyard landscape.

I seem to recall an article in QST that showed use of 1/4 inch
diameter PVC tubing as spacers in a fanned dipole array. However,
Home Depot does not have that size available.
Where can 1/4 inch PVC tubing be purchased w/o goiong through
an OnLine source ?
Does anyone remember which issue that article appeared ?

I would think that spacers used with open transmission line would also
work in my application of a fanned dipole array. So, from where can
spacers be obtained or homebrewed ?

TNX.

OK as far as the statement goes.

>
> The elevation angle is determined purely by trigonometry.

Geometry might have been a better term, but the idea is right.

>
> It tends to be the same at both A and B. There may be simultaneously
> more than one path and therefore more than one angle. In which case
> multi-path distortion and fading occurs.

Here I must inject my experience. As part of a topic sentence, "tends to be
the same" is OK. However, it is common on real HF paths of over 4 or 5 Mm
for the elevation angle at which the strongest signal arrives to be
significantly different at the two ends of the path. It is easy on longer
paths for the major mode at one end to be using a high virtual-height F2
mode and for the other end to be using a low virtual-height E mode.

Allow me to put to rest the notion that optimum elevation angles are
necessarily the same at both ends of a longer (multiple hop) HF path! [Reg
did not say that optimum elevation angle are necessarily the same.]

As other have said, but not all have heard, the idea is to maximize gain
(at both ends of a path) at the elevation angle being used. Even in the
20s, antenna systems were in regular use that attempted to do just this.

>
> Received signal strength depends on the two antenna gains in the

What does exist is a stochastic model of the ionosphere that allows one to make useful estimates of what is going to happen along a path. As has been said many times here, all estimates and measurements comprise at least two numbers: the best estimate and an estimate of the estimate's uncertainty. Even if it were possible to do so, one would not use an antenna that had all of its gain at the predicted optimum elevation angle. One would try to design an antenna (money enters here) that has most of its gain in the expected band of elevation angles expected to be best for a path.

Well reasoned.

Think of a three-dimensional curve of cost, uncertainty, and frequency to measure gain on a range. Think of a second 3D curve involving modeling. My guess is that below something like 20 MHz (use your own number) modeling is to be preferred.

On a related topic: I saw with my own eyes NBS in Boulder (c. 1978) using a different technique to measure gain. It was a near field scheme where a probe was moved in front of the antenna while its vector voltage and position was measured. (As I recall, a pair of lasers was used in the measurement of the probe's x and y position.) The (vast number of) measurements were then imported into a computer that computed the gain. As we say: "you could do that!" I never thought to ask what the expected uncertainties were expected to be.

If I understand correctly, the MFJ tuners have double balanced T networks
and
not double balanced Ls. The double balanced L has a number of advantages
over
the double balanced T, especially if the capacitor can be moved from input
to output,
e.g., the new Palstar or the Bliss tuner. This provides a low pass effect as
well.
Since on the MFJ, the inductor is the shunting element, this is a high-pass
network and
helps to encourage harmonics.

Regards,
Ed, N5EI

You're right, I probably don't notice whether the swr is higher or
lower; all I really notice is about half the time when the line is wet
I have to deviate from my usual tuner settings.

The black plastic irrigation tubing is what I use.
It's very easy with which to work.

Richard Clark wrote:
"Capture area of antennas, 899, 927 of Yerman`s "Electronic and Radio Engineering"."

"Capture Area" seems useful to show that the maximum energy you can intercept in a wave is proportional to the product of directive gain and wavelength squared.

Terman`s examples show that the microwave antenna`s high gain is offset by the extremely short wavelength.

There is only so much energy in a square meter of passing wave. Large antennas access more of it than small ones. I don`t often need to make these calculations.

Richard Clark also says Bailey is "naively assuming a 3 dB gain with each doubling of elements."

It seems to me that the 2nd, 4th, and 8th element may have the same flaws as the first. No matter how good or bad they are, if they are all similar, wouldn`t (n) elements abstract nX the energy in one element?

One of my favorite gems in the newest Kraus "Antennas" is the solved problem on page 705.
Solution:
(A) The gain of a simple 1/2-wave dipole is 2.15 dBi and of 2 collinear in-phase dipoles is 3.81 dNi. The array of 8 such collinear dipoles adds 3 +3 = 9 dB. The reflector screen adds 3 dB more and the ground bounce another 6 dB for a total gain of 3.8 + 9 +3 +6 = 21.8 dBi."

This is the gain of the Deutche Welle antenna which appears on the rear cover of my copy.

Best regards, Richard Harrison, KB5WZI

If you intend using the antenna on frequencies where its length is less than a quarter wave; the losses on 300 TV twin lead can be very high. Also you will likely exceed the breakdown voltage of the TV twinlead. On 7MHz, and above, the TV twin lead will be acceptable.

Forget Home Depot, get familiar with the Mother of All Hardware Stores.

Go to: http://www.mcmaster.com/

In the search box in the upper left corner enter "9446K41" and go.

Also check out #87025K27. Although it's heavier and a bit more
expensive I'd use this PVC Type 2 solid rod stock which is an
electrical grade PVC. It's much stiffer and stronger than the tubing
and it comes in straight lengths rather than being wound in a coil. I
wouldn't worry about the "use indoors" comment, the stuff will last for
years out in the WX. Or spray paint the spreaders black.

AWARD: "POPE JEAN PAUL II - DXSPEDITIONER OF PEACE"

RULES

The section ARI of Sala Consilina (SA), ITALY, desiring to honor and to remember Karol Wojtyla , Pope Jean Paul II has founded the award "JEAN PAUL II - DXSPEDITIONER OF PEACE".

General requirements: Awards are available to all amateurs and SWLs for worked or heard at least 40 countries for BASE award of the 131 countries visited by Jean Paul II during his pontificate; 80 countries worked or heard for SILVER award and 131 countries worked or heard for GOLD award.

All the bands assigned to the Radio Amateur Service and all the modes are allowed, satellites included.

There are 4 versions of the award:

1) MIXED

2) PHONE

3) CW

4) DIGITAL MODES

To claim the Award the QSL cards are not required but they must be in possession of the applicant and could be requested anytime for checks.

To receive the forms for the award application and the list of the 131 countries visited by Pope Jean Paul II you can write to the award manager IZ8AJQ Erminio iz8ajq@amsat.org to receive them on your email address.

The fee is 10 Euro or 12 Dollars. To receive the Award as registered mail please add 3 Euro or 4 Dollars.

Application forms must be sent to this address:

ARI SEZIONE SALA CONSILINA

CASELLA POSTALE N.11

CAP 84036 SALA CONSILINA (SA)

ITALY

|well.

The L network can be either low or high pass. It also has the
disadvantage that the loaded Q is set by the transformation and is out
of the control of the designer/user. With a tee or other network with
greater than two reactances, the loaded Q can be set by the design and
can provide lower loss and less critical tuning under some conditions.

|Since on the MFJ, the inductor is the shunting element, this is a high-pass
|network and
|helps to encourage harmonics.

Well, maybe "doesn't suppress" harmonics is a better way to put it.

Somewhere, I read that the black plastic and grey conduit types were
unsuitable for antenna construction.
And, if I remember correctly, it was (claimed) due to carbon in the black
and metal oxide coloring in the grey...

Was this an old wives-tale?

What's the mechanism by which a high-pass network "encourages"
harmonics? Because a network with a flat frequency frequency response
has the same high frequency response as a high-pass network, it follows
that a network with a flat frequency response must "encourage" harmonics
also. Why?

CalAmp is a leading provider of comprehensive breakthrough communications access and content delivery solutions, services, and products.

We have an exciting opportunity for an experienced Antenna Engineer in Oxnard, CA.

Description:
The ideal candidate will possess a wide range of antenna engineering capabilities ranging from high-level research and development to full product development. The successful candidate must be able to create innovative solutions for ultra high volume and ultra low cost products, as well as have an open mind for new fields and designs. This person will work with minimal guidance and support

Essential Qualifications:

· Design of millimeter wave (Ku, K, Ka) antennas and components such as horn antennas (corrugated and non), reflector antennas, patch antennas (microstrip), OMT's, polarizers, waveguide hybrids and couplers.
· Intimate knowledge of simulation tools, such as HFSS, TICRA, and ensemble.
· Hands on capability of building, testing and fine tuning antennas during prototype and early production stages.
· Must be proficient in measuring techniques such as Far-Field, near field ranges, using lab test equipment such as spectrum and network analyzers.
· Experience in interacting with mechanical engineers, technicians, and production personnel during the full product life cycle.

Frequency Range Experience:

· Ku band
· K Band
· K (10-15GHz, 17-26.5GHz, 30GHz)
· L band (1.5GHz)
· 2.4GHz
· 5.8GHz

Please submit your resume to mailto:resumes@calamp.com
Please use reference code: 25000633 - ANTENG in the subject line.

Equal employment opportunity is basic to our hiring and employment philosophy. Our company believes work results are what count, regardless of race, color, religion, age, sex, national origin, or disability. The company seeks to give all qualified veterans of

military service full consideration for employment.

Yes, but the amount extracted by one element is affected by the presence of the others. So adding or removing an element changes the amount extracted by all the other elements. The effect is known as "mutual coupling", and it explains why, for example, a 2 element Yagi or other two element array can have gain greater than (or less than) 3 dB relative to a single element.

Thank you. Mutual impedance can add or subtract from a total. I assumed the designer would be deliberately combining elements in such a way as to maximize total gain. Plans don`t always work the way we hope.

Best regards, Richard Harrison, KB5WZI

it is possible as long as both output terminals are isolated from the line ground (and case preferably for safety!). many dc supplies connect the negative to the case and line ground so if you tried to put them in series you would short one of them out through the other one's ground.

Richard Fry posted a beautiful picture of a Harris / Gates test facility in which an antenna tower is rotated and tilted up to 90-degrees, I suppose. Nice way to get the antenna pattern. Hope Harris had a government contract number to charge that job to.

Best regards, Richard Harrison, KB5WZI

1518. Using Balanced-Twin line as Tuned Circuit.

New Program "TWINTUNE.exe"

Using a tuning capacitor across one end of a balanced-twin line with a
short circuit at the other, the combination of line and capacitor
behaves as a high-Q parallel-tuned circuit.

Applications include push-pull VHF power amplifiers and power
oscillators.

The program also assists with design of ordinary HF balanced-twin
open-wire transmission lines. Zo and attenuation is computed.

Download program TWINTUNE from website below in a few seconds and run
immediately.

>government contract number to charge that job to.

Azimuth patterns were taken by spinning the antenna+tower around a horizontal axis centered above the two trestle supports you see in the scanned photo. The AUT is positioned broadside to the source antenna.

Elevation patterns were taken by spinning the whole assembly in the horizontal plane, on the horizontal centerline of the antenna+tower assembly. The trestles sit on a huge wooden beam which itself is supported by, and centered on a motor-driven turntable -- making that possible.

So both sets of patterns can be taken without needing to put the antenna+tower in the vertical plane (no tilting to 90 degrees is necessary).

However we had several other positioners for vertical antennas to use when the measurement of elevation patterns was not required.

Yes, this customer had deep pockets, but was not a government agency. Just a major broadcast group.

Correction. Even identical array elements *don't* necessarily extract the same amount of energy. The reason again is mutual coupling. In a four-square receiving array with very low ground loss, one of the elements will actually radiate power. This power comes from power extracted from the wave by the other three. In a Yagi array, the parasitic elements extract no power at all from an impinging wave; only the driven element does.

I am reminded of a day in our engineering lab at Westinhouse Ordnance Department in 1958 when I was working on the depth control system for the MK-45 (ASTOR) torpedo.

Everything aboard the fish ran on 24 volts for a variety of reasons - tradition, it was readily available as a tap off of the main battery, and there was a host of 24 vdc electrical equipment available from the war years.

We had a 24 vdc motor generator set in the lab that produced all of the 24 dc main power to the workbenches in the lab. Each workbench had a pair of wires coming to it with a large two-pole knife switch to connect or disconnect the 24 vdc source.

Each person working at a bench was generally engrossed in his own private hell of trying to make whatever he was working on work properly. As you might expect, no one paid much attention to how his circuitry was grounded locally - if at all.

One day a lab technician named Mike working a couple of benches away from me started laughing about the smoke that he saw rising up from the circuit on my bench. I felt rather stupid about the fact that for some reason my circuitry was cooking, big time. Then I noticed that behind Mike there was a column of smoke rising up from his circuitry, as well.

You guessed it, he had the negative side of the system grounded at his bench and I had the positive side grounded at my bench. We had a

general meeting shortly thereafter.

The thin plastic irrigation tubing has close to infinite
resistance and stays cool in the microwave. It is used
as spacers in presently available open-wire transmission
line.

Here is the scenario:

Hamshack on the west side of the house.

OCF dipole between two trees running perpendicular over the house with the Balun directly above the shack (now *that* is handy)

Butternut vertical on the east side of the house. 12 radials so far.

Now here is what brings about the question. Over the winter months, I had to have my sewer line to the street replaced, which ended up making a huge mess out of my front yard. This means that I will probably end up tilling and replanting a large part of the yard.

Is there any point to laying radials in the front yard? They would be quite a ways (~50 feet) from the radials around the Butternut.

The main reason I ask though, is that I thought I heard here some time ago, that a dipole would perform better over a good ground system.

Roy Lewallen, W7EL wrote:
"Even identical array elements "don`t" necessarily extract the same amount of energy. The reason is again mutual coupling."

Yes, and driven elements have a load. Parasitics do not.

In a parasitic array, the field strength at a distant point is a function of the currents in both elements when it consists of two dipoles.

It is true "the parasitic element extracts no power from an impinging wave". It has no load to accept the power. It is a short-corcuit rod or wire. It has current induced from a passing wave of acceptable direction and frequency whether its source is from a driven element or from a far away transmitter.

The excitation of a parasitic element, if no heat is produced in the slemsnt. is 100% re-radiated. The element has a resistance which consists of its self resistance and its mutual resistances. The total composes the radiation resistance of the element which is the source resistance for the radiation from the element.

My original comment was in support of Arnold B. Bailey who said something about increasing antenna gain by 3 dB every time you double its size. Precisely, that`s not true, but I gave an example from Kraus where he did much the same thing.

Best regards, Richard Harrison, KB5WZI

And thanks for this also.

I had a nicely useful, yellow, roughly 11x14, hardcover book that was a handy audio manual that was lost during moving a couple decades ago. It covered beginning through midrange complexity, and had a decent tutorial on bi-amp. Also had a description of Indy Speedway Pit announcement system, high sound pressure level, baseball stadium sound system, and R&R, may have been The Grateful Dead. I think it may have been a husband and wife team that wrote it. Ring any bells? I'd like to order a copy of it.

hmm. We'd better define better! And with that hard to define effect "mobility", I wouldn't bet the house on it.

It looks like the major advantage is the light weight.

Of course that may be somewhat negated by the other promise of carbon - the carbon ribbon that will allow us to build a space elevator!

> Will this make a difference in Audio?

The audio geeks will be able to make up stuff for years about this......

Another example that can be divorced from ground effects and easily
modeled in free space is a 4 by 4 array of yagis - an EME array. The
corners are one set, the outside horizontal pairs are another, the
outside vertical pairs are another, and the inside 4 are another.

I have a simple 4 by 4 by 3 element AO array as an example if anyone
would like a copy.

Does this mean that the resistance per ft for nanotubes is 1/10th that of
copper?
Are they comparing this performance by weight or by volume of wire
("pound-for-pound", or "cross-sectional-area")
Then we have to talk about tensile strength of this stuff for
supporting its own weight between trees to use as an antenna
Then ya gotta conjure up a way to solder the feedline to it. (or make
feedline out of it)

I also wonder about 'good grounds' for dipoles.
If your terrain was very sandy - so much so that it would take over a hundred ft of
ground rod to make a difference - then would this mean that your antenna would
perform as though it was 100 ft higher - than over "normal" ground. ???

I've seen industrial plants use "ungrounded 480volt delta" system, and with this system, if
any of the 480 v legs come into contact with "ground" (say a wet piece of concrete floor)
there would be no sparks - as that corner would become the grounded leg.

If the resistance is 1/10th that of copper then it should be possible to manufacture helical inductors with Qs approaching 10,000. Not only that, but open wire transmission lines would have very low loss, therefore making it feasable to feed antennas with very small electrical dimensions. How to handle the votages involved would be something else!

Frank

You know--this almost sounds like science fiction to me--if I had not already been witness to truth being stranger than fiction--I'd think, "FAT CHANCE!"
However, my audio is fine, it does not need any improvement to please me more... BUT, antennas are a different story, it will revolutionize them!!!
And, how about PC boards, your traces would only need to be 1/10 the size!
And, how about semi-conductors themselves???
etc, etc, etc....
The future only gets better and brighter....

Regards,
John

==========

No point in laying radials. Too far away from the Butternut. Current
does not flow that far along buried wires. Attenuation along the wire
is too great.

What evidence is there that they've defeated skin effect? If they
haven't, the advantage drops to the square root of the DC advantage
(e.g., a little more than 3:1 if the DC advantage is 10:1). Also, I
wonder if the bulk resistivity of these gadgets remains constant with
frequency like solid copper, or rises with frequency like
superconductors. If it rises with frequency, then the advantage becomes
less yet, potentially even becoming worse than copper at some frequency.

Dear Ed (N5EI):
Thanks for the correction. The last time that I went to MFJ's WEB
site, I was no longer able to see the tuner's schematic. I should have
made a better record when I was able to see the schematic. One does not
think of that until the manufacturer removes what should be an important
part of their advertising. I had remembered the configuration as having
only three reactances with two of them being ganged (and a BBC (big bad
choke) at the input)

You might be mixing dc-theory with rf, and looking for a particular relationship that's not there. The antenna is not 100' higher electrically as you suggest. In terms of your 100' ground rod, just because it might take that deep a hole to achieve say, 5 ohms dc-resistance, that does not make the surface or an antenna above it at an elevated potential with respect to each other.

A dipole certainly behaves differently over varying resistances of soils. But the efficiency differences have never been equivalent to the antenna being at a different elevation because of soil conditions. Now maybe I get away with less ground loss from a half-wave dipole that is not quite a half-wave above ground, because my soil is very sandy, is that what you meant? It doesn't change the electrical height of my antenna any, but the soil is such a lousy conductor that less is absorbed by a slightly too-low antenna.

Jack

You're probably right - but then why does the operator on the hill get
better recption than the one in the valley.
if sand is an insulator, then being on top of a 100-ft pile of sand would be
like at the topp of a glass tower, right?
why not?

Reg Edwards wrote:
> Roy, you are a pessimist.

In my career doing electronic instrumentation product development, I learned to look for all the potential problems I could think of, as early as possible. A lot of them turned out to be non-problems, and could then be ignored. But the ones which were real had to be overcome, or at least had to have a good probility of being overcome, before the project could proceed. If it couldn't be, another approach usually had to be found or the project abandoned -- or at the very least an alternative approach had to be identified in case the problem couldn't be overcome. Too often, a naive ("optimistic") project manager wouldn't do this, and would run into a project-killing problem 90% of the way into the project. That can be a disaster, and I've seen it happen many times. Of course, it's ok to go into a project knowing there's a potential program-stopper, as long as you know it up front and are willing to accept the consequences if it can't be overcome. This is the approach often taken by startup companies, but the high risk of failure is too often conceled from the suckers, um, investors. A great number of announcements of revolutionary technology tend to ignore, deny, or minimize potential problems, limitations, and risks. So I don't consider it pessimistic at all to assume they exist. Once in a while, the serious problems are overcome and a new and useful technology emerges. More often, nothing emerges but a lot of investors with thinner wallets and more critical outlooks.

I really hope the nano-tubes will bring us amazingly high Q coils. Then all we'll have to do is figure out how to keep them far away from anything else. Gee, maybe some new magical field-masking technology will emerge in the nick of time to solve that problem. There, was that better?

At work we had an issue with the use of nylong tie-straps on our test
fixtures that were used during RF testing (moderate power, Ka band).
Well, I'm in the mechanical side of the house but suggested the
microwave test & pretty soon I was surrounded by RF guys who heard
about my answer and were interested in why I thought that would work -
when I explained it they were not only satisfied it would answer their
concern but were rather impressed that a guy who does mechanical
ground support equipment came up with it. None of them were Hams. I
think it's great that our hobby can help us out in other ways.

Howard

Roy has a point.The article was very sparse with real fact, but rich in
speculation and totally void of specifications.
They were working on a 3 ft piece of this conductor for testing - so they
didn't have their eye on making a dipole for 160m - more than likely. :-)

Well, the irony of which Fred (W4IJE) replied surely applies - it seems to have the same effect as "raising the antenna", which I did also admit. So the only point I struggled to make was it is not electrically higher. Height of an antenna surely helps us in all cases, and part of that is related to a dipoles most efficient design height above ground, part is because we clear interfering objects in the near and far fields when we "elevate" ;-)

I wouldn't stand on a tall sand hill in a thunderstorm, lightning would sure be happy to race through you and down the side of the sand pile on its way

to a more conductive earthing! But a dipole erected 1/4 - 1/2 wave above the same tall sand pile should be quite happy - especially if the Atlantic Ocean was on one side, the Chesapeake Bay on another, and inland waters on a third side. That pretty much describes the "hill" off the beach that I live on.

Mike, KB3EIA wrote:
"The main reason I ask, is that I thought I heard here some time ago, that a dipole would perform better over a good ground system."

It may not.

At a distant point, the received signal is probably composed of two parts that started their journey as an incident ray and a ray which was the incident ray`s reflection off on a tangent from the surface of the earth.

If by good fortune these two rays happened to arrive at the distant receiving point in-phase they would present a stronger signal than the direct ray alone, and certainly a stronger signal than a combination of two out-of-phase signals.

Unfortunately, the incident wave`s reflection is always out-of-phase with the incident wave which produces it at the reflection point. A perfect reflector would ensure the reflection was equal in magnitude as well as out-of-phase to the incident ray.

Unless you get a difference in path length between incident and reflected rays to invert the phase of one of the rays as compared with the other, they will tend to cancel. You might be better off without the reflected ray.

The ground connection in a vertical antenna system is entirely different. Half the antenna system is the antenna`s image in the earth. The connection to the earth or to a capacitive coupling to the earth (elevated radials or ground-plane) carries the r-f current to the earth side of the system. Any resistance in your gtound system directly adds to loss in the system.With the usual vertical antenna system, radials are essential.for efficiency..

This was a long-winded way to say you don`t need radials with a horizontal dipole for r-f efficiengy. You do need a ground connection for electrical safety and lightning protection. Radials work well for these too.

Best regards, Richard Harrison, KB5WZI

Hi Mike,

You heard correctly. The ground system lowers losses which translate
to more power out. This is not method of controlling TOA, simply loss
- all angles of radiation improve.

I don't have the results published, but I have a near field study
showing interesting results for a dipole over ground, and over
shielded ground at:
http://home.comcast.net/~kb7qhc/antennas/Fields/Dipole/index.htm

For NASA to hand that off to a college with an initial eleven-million dollar grant, I'd speculate that they have already confirmed the effect in question...
I am thinking they are now working on producing it in sufficient quantities and dimensions to make it applicable to practical use...
Indeed, it looks like the length they have in mind will reach space--if so, that monopole will make a good muli-wavelength antenna for ultra-lowfers!!!
Perhaps it will be naturally resonant at the Shuman frequency and Earth itself will begin to CQ DX! <grin>

One more thing, when you start swinging a wire around in a magnetic field--you begin to generate a current and voltage/power... although the Earth's magnetic field will be moving with the wire, and so produce little or no effect (there are "wobbles" in this planets magnetic field of course) there surely must be some kind of magnetic field from the sun and/or other planets which reach Earth--"free energy?"

The circumference of the Earth is 25,000+ miles and it does one revolution in 24 hrs--unless I am mistaken that wire will be "whirling" at greater than 1,000 mph--if nothing else, a wire spinning at that speed sounds impressive, especially when you figure in it will be a superior conductor!!!

I seem to remember one of the shuttle missions letting out a very long tether--it, somewhat, "mysteriously" burnt or severed--and, if I remember correctly, they noted a large current in the tether they did not expect.... perhaps someone else remembers this incident more clearly?

Regards,
John

I stand corrected. Spurred by your response to do a more exhaustive search, I found "capture area" in the indices of 3 out of the 12 antenna texts and handbooks I have, plus in Terman's _Radio Engineering_. While aperture is more commonly used (judging by this sample), "capture area" is indeed in use outside the amateur community.

Think I'm likely to find "S-Unit" if I look hard enough?

An OK general announcement that is rather a hodge-podge of facts and characteristics. Wired is hardly a cutting edge science venue. One particular howler is the construction of a "quantum wire" from a wrapping of several many nanotubes. This is a contradiction in terms. The nanotubes are already quantum wires, in fact they are called 1D forms.

Being "quantum" anything, they are consistent in exhibiting non-linear electrical/physical properties. Ohms law (being yet another model that those who lambaste models would be surprised to learn) fails to uniquely express what resistance this wire would exhibit (Onsager's Relation drawn as a Landauer curve). However in conductance measurements, carbon nanotubes will support a billion Amperes per square centimeter.

However, no carbon nanotube is a square centimeter, being more often 10s of nanometers in diameter, they are still not square (area) defined (that "quantum" thingy again). The problem of the article is that it is mixing the bulk carbon nanotube properties with the quantum carbon nanotube properties - not at all the same thing. This is why the conductance of a quantum nanotube wire in billions of Amperes plunges to a rather more mundane 1/10th the resistance of copper for a nanotube bundle.

The quantum properties quite rightly dismiss any notion of skin effect, current travels inside the tube. In fact, it also distorts the shape of the tube like a snake swallowing a golf ball. Even more interesting is that current will flow in the opposite direction of the applied EMF if there is a sufficient heat differential between the ends (it doesn't take much heat because carbon nanotubes are exceptionally good heat conductors). Firstly, getting current into a carbon nanotube is not a pretty thing as they exhibit what is called "non-reproducible behavior" by their nature of having a great variety of conduction configurations that all arise out of their binding to a contact material. For nano-conductors, contacts dominate everything.

All-in-all, the introduction of a new technology is frequently confused as a better version of an old technology - something like saying facsimile would replace the newspaper - or that the utilities would pay us to use nuclear power. All the "forecasts" mentioned in this article rank right up there with these world class pipe dreams.

I'm glad you did get yourself to contribute to the discussion. I'm by no means an expert when it comes to propagation (and quite apparently several other participants aren't either), and I've fallen victim to using oversimplified models where their use isn't appropriate. The little reading I've done on the topic shows there are some really interesting phenomena involved which don't at all fit with the notion of simple reflection or refraction from a layer at a single height. Thanks for reminding us about one of the more important ways in which the simplified models are misleading.

+3dB is a valid generalization, based on sound physics - but it is only
a generalization.

At the time those Grand Old Men were writing their textbooks, such
generalizations were the best that anybody could manage. But they had no
way of checking their accuracy - or more important, why and when they
start to become INaccurate.

50 years on, we do have a way, and we now know much more than they did.
That makes it very dangerous to quote those Grand Old Generalizations as
accurate and universal truths. Richard was quite correct to describe the
"+3dB rule" as "naive" - because, at today's level of knowledge, it is.

But we still need to know that the +3dB generalization exists; and
understand the fundamental reasons for it. That fundamental
understanding is what protects us against stupid mistakes.

On the other hand, sometimes the assumption that the new technology will simply replace the old falls staggeringly short. The total market for transistors was initially seen as being the same as for tubes -- replace each tube with a transistor, and that's it. Hardly worth developing the technology to overcome the gnarly manufacturing problems (e.g., extreme purity requirement of the base material). No one foresaw the integrated circuit, making it practical to put the equivalent of hundreds of transistors in a pocket calculator, wristwatch, or even an electric iron. The transistor made possible a whole new technology with applications which were altogether impossible and therefore unimaginable with tubes. But the best that the soothsayers can ever seemingly do is to extrapolate from what we've got right now. Maybe the nanotubes won't end up being simply a replacement for wires, but the basis for a whole new technology we can't now conceive.

And maybe they won't. Every entrepreneur does his best to convince investors that his invention will be the next integrated circuit or his garage company the next Microsoft. But the odds are sure against it.

A current balun (as described by W2DU in his book ''Reflexions''), put at the center of a dipole, prevents HF current from flowing in the outer shield of the coax. This is due to the high impedance caused by the ferrite rings. Now, if instead, I put a voltage balun, what should prevent the current from flowing in the outer shield of the coax? Am I missing something?

Thanks for helping.

Chris

No doubt the 'GOM' knew the exact gain changes from successive doublings of an antenna aperture, or could calculate them if they wished to. The difference between the two isn't very important except when it is part of the equation to arrive at some legally required ERP, such as in commercial broadcasting.

Below are the gains of a series of commercial FM broadcast transmit arrays to illustrate the point. The elements (bays) in these arrays all are one wavelength apart, and driven with equal power and phase.

Elements C-pol Gain (dBd)
1 -3.55
2 -0.21
4 3.09
8 6.34

Starting with the gain of the 1-bay and adding exactly 3 dB per doubled aperture in this example would result in 5.45 dBd gain for the 8-bay, meaning that FM ERP when using this approach would be more than 18% below its licensed value (illegal).

Because the inside of the oven tends to get warm and steamy, everything
tends to warm up a little. It's best to compare the material you're
testing against samples of known good materials like PTFE, polyethylene
(the insulator from RG214) or a hot-melt glue stick.

The regular translucent hot-melt glue material (amorphous polypropylene)
is also an excellent RF insulator. It's useful for all kinds of antenna
building and weather-sealing.

Note that the intrinsic, free space pattern/gain of a dipole does not depend in any way on the presence or nature of a ground plane.

Reflections from the ground (and other objects) can modify the classic donut shape of the dipole pattern and produce relative gain in some directions, at the expense of gain in other directions. But the "power out," or absorbed by a matched dipole will be the same in any case.

A low-resistance ground system will increase the fields radiated from an antenna that uses the earth as an 'image' part of the complete radiation system, such as the vertical mast radiators used in MW broadcasting. With a perfect ground in this situation, the base current in the vertical mast is twice what it would be for the same power applied to an equivalent wire dipole (less a ground system) in free space -- resulting in 3 dB system gain.

W2DU's device is not a balun. It has no ratio - it is just a choke.
It behaves in the same way as a single bifilar winding on a ferrite
rod, or on a ring.

But a choke does not necessarily prevent longitudinal standing-wave
currents on the line. It merely shifts standing waves to other
positions along the line.

If a choke is located at a current minimum it may serve no useful
purpose at that operating frequency.

A true balun transformer, whatever its ratio, by itself provides no
obstruction to longitudinal currents. There can be a direct connection
between the line and antenna.

Reg, G4FGQ.

Indeed. There's enough snake-oil being sold to audiophiles as it is.

Unless and until stereo mags and listeners actually do proper
double-blind tests, I think we can assume that this wire (if it ever
goes into general production) will be yet another way to liberate
hundreds of dollars a foot from gullible consumers.

Scanning my library I spy:

"Fundamentals of Single Side Band", 2nd Edition, Sept 1959, Collins
Radio Company, Cedar Rapids, Iowa.

On page 13-7, in describing the circuitry of the 75S-1 it says in
part:

"The S-meter is calibrated in S-units and dB. The S-unit scale is
standard up to midscale (S-9). The db scale reads relative signal
strength above the avc threshold which is approximately 1 microvolt.
Thus 40 dB on the meter is 100 microvolts of signal (which also
corresponds to S-9 on the S-unit scale). To read dB over S-9 on the
S-unit scale, subtract 40 from the corresponding dB reading. For
instance, a 60-dB reading would be 20 dB over S-9 (100 uv) or 10,000
uv of signal at the antenna. This reading is then 60 dB over the dB
scale reference of one microvolt and 20 dB over the S-9 reference of
100 uv"

Whew.

Next to it I find:

"Amateur Single Sideband", 1st Edition, 1962, Collins Radio Company,
Cedar Rapids, Iowa.

Its only reference to S-meters is on page 111 where, in a section on distortion tests with a receiver, it states in part:

"Variations and nonlinearities in S-meter calibration can introduce considerable error in the measurement of signal levels by means of a receiver. The commonly used figure of 6 dB per S-unit is appreciably higher than the actual response of many amateur receivers. The meter in the S-Line receivers, for instance, is calibrated to read approximately S-9 with and input signal of 100 microvolts. The agc threshold is set nominally to 1.5 microvolts, and varies slightly from band to band. Therefore, the total range from S-zero to S-9 under normal conditions can represent 30 to 40 dB or from approximately 3.3 to slightly over 4 dB per S-unit."

Wherever did you get the idea that a balun "must have a ratio?"

"Balun" is a contraction of 'Bal'anced to 'Un'balanced. Walt's device certainly fulfills this function.

Hi,

I am thinking out loud about how the semiconductor LED evolved into the laser diode, by exploiting the synchronized population increase mechanism to generate monochromatic photon emission. Might it be possible to scale down this electron mechanism to usable radio frequencies and end up with a radio transmitting antenna that doesn't require aerials? Might this device then be termed a radio diode?

From: Cecil Moore <w5dxp@hotmail.com>
Message-ID: <427109b1$1_1@127.0.0.1>
Source record: 78252
Body handling: Binary attachment payload not displayed: v30-4e.EZ

I'm considering putting up a 1/4WL vertical for 30m
with four slanted elevated 1/4WL radials. I looked
at all the bands, 40m-10m. Take a look at the
performance of this antenna on 10m where it is
an omnidirectional 5/8WL, 4.28 dBi at 10 deg.
Note the four radials are also 5/8WL.

Keep the 5/8WL vertical on 10m and shorten the
radials to 1/4WL (8.25').
0.57 dBi at 10 deg.
3.5 dBi at 24 deg.
4.4 dBi at 53 deg.

Looks like 5/8WL radials may work better for a
5/8WL vertical than 1/4WL radials.

Actually, I have a set of "dummy loads" for microwave ovens, don't remember where I picked 'em up at (gov't auction?)... they seem to be silicone rubber??? impregnated with some kind of conducting material (carbon? Metal oxide?) You surely must be able to get 'em from a "microwave tech?" You can even use a thermometer in them, "nuke" for a certain time and arrive at different measurements--mainly power output....
I am sure some here have seen these things and can describe them much better than I....
But, the smaller ones work perfect for my "microwave experiments" (ever chuck a fly in a bottle and see how long it lives in microwave environment?) (chuck a BIG one of these dummy loads in, and the oven won't even warm a glass of water, or seemingly, harm a fly!!!)

Regards,
John

Richard Fry wrote:
"With a perfect ground in this situation (MW vertical tower) the base current in the vertical mast is twice what it would be for the same power applied to an equivalent wire dipole (less a ground system) in free space -- resulting in 3 dB system gain."

I`m not agreeing or disagreeing, just listing facts.

Arnold B. Bailey in "TV and Other Receiving Antennas"on p. 500 gives the gain of a horizontal half wave wire (thin), center-fed as zero dB at its center frequency. He should. It is his reference for all other antennas. His authority is the famous G.H. Brown in Proc. I.R.E., Vol. 33, p. 257, April 1945. Antenna resistance = 60 ohms.

On page 538, Bailey gives the free-apsce gain of the quarter-wave vertical antenna. It too has a gain of zero dB = 0 dBd. His authority is A.S. Meier & W.P. Summers in Proc. I.R.E., Vol. 37, p. 609, June 1949. Antenna resistance 28 ohms.

Power is current squared times the resistance..

Terman says on page 886 of his 1955 edition:
"Effect of Ground on Directive Gain of Ungrounded Antennas. Consider an antenna is far enough from ground so that the total power radiated by a given set of antenna currents is independent of the presence or absence of the ground. Then a ground reflection that reinforces the main lobe will double the field strength of the main lobe, and so will increase the directive gain of the antenna system by a factor of 4." (thet`s a power ratio of 4)

On page 885 Terman says:
" Consequentially (due to ground reflection nulls), to obtain strong radiation in the directions approaching the horizontal using a horizontally polarized radiating system, it is necessary that the height of the antenna above the earth be of the order of one wavelength or more."

Also on page 885 Terman says:
"In the case of horizontal polarization the effect of imperfect ground is seen to be quite small, especially at low vertical angles. With vertical polarization the ground imperfections have greater effect; in particular, the filling of the nulls at moderately low vertical angles is very pronounced."

For the power to be the same in a vertical mast and a wire dipole, the I squared R must be the same in both cases.

Best regards, Richard Harrison, KB5WZI

And, the
> microwave will be my authority...

You might wind up throwing the baby out with the washwater. Somebody somewhere once pointed out to me that many materials have different resistivities at different frequencies, the higher the frequency the lower the bulk resistance. One implication being that a candidate spreader material which gets hot in a 2 Ghz microwave oven does not necessarily mean it will be at all lossy at 7 Mhz. The FCC human RF exposure limits rules are based in this principle. Being a few feet away from an antenna radiating 100W of 40M RF is not a problem, 100W of 2 Ghz RF into the same antenna is deadly or close to it, etc.

About a year ago I picked up some 2"-3" scrap lengths of carbon fiber composite hunting arrow shafts from a local sporting goods store and put them to the microwave test. This material has an extremely high strength/weight ratio which makes it attractive for use as spreaders.

They got pretty warm after nuking them for five or so minutes. Then I checked several of them with my DMM set to it's 200 megohm range. In all cases the DMM indicated completely open circuits. From this experiment I've concluded that this material is plenty "good enough" to use for HF feedline spreaders. Unfortunately it's a bit difficult to drill & cut.

Balanced to Unbalanced WHAT ?

"Balun" is a contraction of "Balanced to Unbalanced "TRANSFORMER".

What is the transformation ratio of the W2DU "balun" and other devices
which serve a similar purpose? Between which pair of impedances does
it match?

If YOU cannot provide answers then there are many old-wives who can.

There is a program named BALCHOKE available free from my website.

I have no wish to participate in futile arguments about the meaning of
words. They can drive one to drink

You are correct on this point, it is actually an "UnUn."
(UNbalanced-to-UNbalanced--don't confuse this with a child's pronouncing of
"onion.") <grin>

Resorting to passive voice - The W2DU choke is considered to
be a 1:1 balun. Each bead is considered to be one turn. If
one mounts the beads on a piece of 50 ohm coax, it becomes
a 50 ohm balanced to 50 ohm unbalanced balun. With 50 ohms
on both sides of the balun, the Z0 of the transmission line
used should be SQRT(50*50)=50 ohms.

1605. Re: Yet another BALUN questions

Newsgroup: rec.radio.amateur.antenna
Date: 2005-04-28 18:42:35 UTC
From: Roy Lewallen <w7el@eznec.com>
Message-ID: <1172bkuac8nmcd0@corp.supernews.com>
Source record: 78268

The difference between a 1:1 current balun and a 1:1 voltage balun is that the latter has a third (tertiary) winding. I'll assume for a moment that the baluns are perfect, i.e., have an infinite common mode impedance. If the load is balanced, that is, if the two load terminals have equal impedances to the "cold" side of the balun input, the third winding of the voltage balun carries no current, and there will be no current on the outside of the coax. Because the third winding has no current, it can be removed with no effect, so the voltage balun acts exactly like a current balun when the load is balanced. However, if the load isn't perfectly balanced relative to the input terminal of the balun, a current balun will still prevent current from flowing on the outside of the coax. The voltage balun, however, will force the voltages at the two output terminals to be equal and opposite relative to the cold side of the balun input. This will cause unequal currents from the two terminals. The difference flows along the outside of the coax.

In summary, the best a voltage balun can do in preventing current flow on the outside of coax is to be as good as a current balun, and this happens only if the load is balanced. In all other cases, using a voltage balun will cause current to flow on the outside of the coax while a current balun will prevent this flow.

For more information, see the article posted at http://www.eznec.com/Amateur/Articles/Baluns.pdf.

I wrote:
> "With a perfect ground in this situation (MW vertical tower) the base
> current in the vertical mast is twice what it would be for the same
> power applied to an equivalent wire dipole (less a ground system) in
> free space -- resulting in 3 dB system gain."
to which Richard Harrison responded.

Excuse my inaccurate statement about that current, and thanks for catching it.

The input resistance of a 1/4-wave monopole working against a perfect ground plane is 36.5 ohms,* or half that of a 1/2-wave dipole in free space. A given input power then results in 1.414X more current in the monopole than the dipole. Hence the monopole radiates 1.414X the field of the dipole. And, as shown in Kraus 3rd edition, Table 6-2, a 1/4-wave monopole against a perfect ground has 3 dB more gain than a 1/2-wave dipole in free space.

Increasing the field from the 1/2-wave, free space dipole by 1.414X in the above example would require doubling its input power (3dB), which would result in the same 1.414X increase in its current -- to the same value as seen in the monopole with 1/2 that power.

* per Kraus 3rd Edition, p 567

Richard Fry wrote:
"The elements (bays) in these arrays all are one wavelength apart, and
driven with equal power and phase.

Elements C-pol Gain (dBd)
1 -3.55
2 -0.21
4 3.09
8 6.34"

Bailey`s Table 10-I, which Richard Clark referred to as "naive", appears
on page 484 of "TV and Other Receiving Antennas".
The heading is Array Gain (approximate rule).

Nunber(of Half-Wave Rods (N) and
Numeric PowerRatio Gain (dB) 1
0
2 3
4 6
8 9

First difference from Richard Fry`s table is the loss of 3.55 dB as the
result of circular polarization (mostly) as half of the power which a
linearly polarized reference dipole would
use is cross-polarized.

The steps between doubling the number of elements in Richard Fry`s table
are all nearly 3 dB. Bailey says "approximate rule". He is vindicated.

Best regards, Richard Harrison, KB5WZI

That, and the fact that the radiation pattern from each element is not the pure cosine function assumed for a 1/2-wave dipole. It has slightly less gain peak gain.

> The steps between doubling the number of elements
> in Richard Fry`s table are all nearly 3 dB.

"Nearly" is right, but the difference is not uniform for successive doubling of apertures.

A small variation in the bay-bay spacing (departing from 1 wavelength) is needed as a function of the number of bays, to maximize the peak gain from this type of an array. The arrays in my table all have exactly 1-wavelength element spacing, and the peak gain from arrays of them is lower than expected for lower numbers of elements, and higher than expected for higher numbers of elements -- which stretches/compresses that nominal 3 dB delta.

Fine points, to be sure.

Sure...Old news to me....:)
http://web.wt.net/~nm5k/acompari.htm

I've used that exact antenna...was designed mainly as a 5/8
for 10m, but also used it as a 1/4 on 30m.. I used 3/4 wave
radials the last time...."10m".
I also did the same thing on 40/17...My full size 40m GP
doubled as a 5/8 on 17m. I used a 24 volt relay to switch
in a loading coil for the 5/8...In modeling those,
I found the 5/8 should have more gain than the 3/4 radials,
but seems to me, the 5/8 radials would need to be tuned to
work properly...IE: think dual 5/8 radiators...One up, one
down...The 3/4 radials are a good match as is, being the
reactance is tuned out with that length...
BTW....Vuuuurrrryyy important...If you dual band it, you
must use an ungrounded series matching coil. There can be
no dc connection to ground, if you want it to work on 30m.

I guess I forgot to say I plan to use it on 40m-10m driven
by an SGC-230 which will match virtually anything. The
resistive impedance and the reactive impedance are less
than 1000 ohms on all bands so I think the SGC-230 will
not be extremely lossy.

I once forgot to attach the Hustler coil to the Hustler
bottom section so the antenna was about four feet long
with no loading. The SGC-230 faithfully loaded that
four foot long vertical on 75m. But please don't ask
about efficiency.

LEDs don't emit coherent radiation. All your jumbo "RED" would do would
be to emit wideband noise.

Wired Mag. is far from being all "hype", it is on the cutting edge of making the public aware. a practice which the news media has abandoned.

Such as the following article:

http://wired-vig.wired.com/wired/archive/11.09/diamond.html

However, since the great majority of people do not realize what this means, they still purchase diamonds at ridiculous prices. I wish they would stop, as hard as diamonds are, I'd like to pave my driveway with them!!!

John, I'm glad you said "ya!" rather than "the program".

It is a fact that, these days, computer programs are far too often, unjustifiably, treated as The Bible. It's similar to quoting or misquoting the popular works of Terman, Brown and Kraus and inevitably taking them out of context.

The most important characteristic of a program is it's Reliability. And Reliability is a measure of Quality versus Time. And Quality is a function of the programmer's ability to understand the real world, to model it, and mathematically incorporate the model in his or her programs.

Quality and Reliability, in the broadest sense, are measures of the degree of conformance to the intended purpose. Indeed, they can be measured.

However, people such as school teachers strenuously object to being subjected to work measurement. Whereas skilled factory machine operators are quite accustomed to it and their pay often depends on it. You don't get paid for scrap.

It's time Prime Ministers and Foreign Secretaries were paid according to their Quality performance.

But I've strayed far enough from lecher-lines. I appreciate your comments which induced me into it.

This last post prompted me to have a look at that webpage of yours... and I scanned the bio you did on yourself...
Funny, but before I read that, you looked more American than an AMERICAN! to me...
I was shocked at your age too, I imagined you my age (52) or younger (younger actually!) If your text is any sort of window on your mind--you have managed to hold on to a youthful one!
It is a damn sorry state of affairs when the darn Brits start looking more like American--than the Americans do!
Pascal was my favorite language--until I discovered "C"--and Borland TuroPascal ROCKS!!!!

Warmest regards,
John

To all and sundry,

My prediction about old-wives was correct.

Anybody who provided a transformation ratio or mentioned matched
impedances can consider him or herself to be an Old Wife.

It would be a waste of time for me to explain to Old Wives how the
uncertain impedance and length of line on the choke, combined with the
unknown impedances of its supposed terminations, actually works.

The impedance transformation ratio is entirely INDETERMINATE.

But it doesn't matter two hoots provided the length of line on the
choke is within certain limits. Only the choking action on
longitudinal currents matters.

You are thinking power xfrmr, where an isolation xfrmr is isolating from ground loops, or possibly even dc.
A 1:1 unun is isolating from rf, the "choke" is implied!

"Don`t spoil the fun! <sad-face>"

According to my online encyclopedia, the Maser is not new. It appeared in the Soviet Union about 1952 and was quickly adopted in the U.S.A..

Early Masers got stimulated emission in a stream of energized ammonia molecules at 24 gigahertz.

Nobel prizes in physics were awarded in 1964 for Maser developments.

The last 40 years has seen emphasis shift to Optical Masers (Lasers). These now have many applications from surgery to chart pointers. They are also used to cut metal.

Not quite as many varieties as Baskin & Robbins yet, but the game is new. Lasers come in many colors and power levels. Wavelengths are in hundreds of nanometers. 193 nm is UV and comes from argon flouride. 10,600 nm is FIR from Carbon Dioxide. This is the metal cutter.

Find the right material and discover how to tune it to the frequency of your choice. You may have a new HF generator. You may not have obviated wave guides and antennas appropriate to the frequency.

Best regards, Richard Harrison, KB5WZI

Hi All,

Getting smaller....

I calibrated the sonar domes in the Navy, and then pressure tested
them for Honeywell at their Marine Systems Division here in Seattle.

Funny story about that. The pressure vessel was controlled by an
ancient program running in FORTRAN (if you can imagine that).
Honeywell asked me to consult (after I had been a Metrologist for them
some years earlier) on how to translate the FORTRAN to HP Basic.

That sort of drew a slack-jawed reaction from me, it was rather a
regressive move. I suggested that the HP computers had a very nice
Pascal that would do a lot better, and the fireworks went off.

"Pascal? Isn't that one of those European commie languages? It is
written backwards isn't it?"

Management wanted to read the code. The handwriting was on the wall
and it spelled DOOMED.

Your flashlight likely has a DC-DC converter in it to keep the light output relatively constant as the battery voltage drops. That would be the source of the RFI. It's also possible that the LEDs are multiplexed so that one won't hog all the current as they would if parallel connected. That also could create considerable RFI. Although the RFI is radiating from the components you mention, they aren't its source.

Hi All,

When I was a kid, I had an issue of Mad Magazine that published a commemorative piece on notable unknown inventors, one of whom was George Foont, the inventor of the Lazier Beam. The picture showed the proud inventor with his invention whose beam of radiation shot out a foot or two, and then drooped to illuminate the floor in front of him.

I also recall another, more sophisticated entry from the New Yorker. It was with an inventor and his patent lawyer standing at the street window of the lawyer's hi-rise office. The lawyer was holding the beam projector aimed out the window, but a look of disgust was evident in his expression:
"Death Ray!? It doesn't even slow them down!"

I don't think that's a valid excuse. The 3 dB rule applies to phased arrays only when mutual coupling is ignored or in a few special cases. Mutual coupling had to have been known at least at the time of the invention of the Yagi-Uda antenna in 1926, and probably long before that. It was being calculated for geometrically simple antennas at least as early as 1943 (cf. R. King, Proc. IRE). Work proceeded rapidly through the '40s, with papers describing increasingly accurate techniques with antennas of increasing complexity.

We now have the means to calculate mutual coupling much more easily than before, and for geometries which were impossible to deal with before we had computers to do the work, but I don't think we've modified our understanding of the phenomenon for many decades (some notable antenna charlatans notwithstanding). Anyone measuring the gain of a short Yagi, the gain of which routinely exceeds 3 dB per doubling of elements by a considerable margin, must have become aware of the shortcoming of the 3 dB rule.

I suspect that if we were to read the cited quotations very carefully, we'd see qualifications that explain neglecting mutual coupling.

John Smith wrote:
"I have a high power LED flashlight. 5 superbright LED`s in the element...it is bright. If I bring it near an AM radio, I lose all reception."

I have a Timex Indeglow watch with a fairly dim dial illumination when I depress the dialstem. It wipes out radio reception too. I suspect that solidstate diodes are noidy devices. They are efficient though as the light is not accompanied with much heat. As for diode noise, zeners are often used as noise generators, are they not?

There are various ways to get an atom`s orbital electrons to move to a higher energy level. You can throw a stick on a fire or aim an electron beam on a CRT phospher.. From a laser, we`re looking for coherent radiation.

Best regards, Richard Harrison, KB5WZI

Well, you might be right at that (and contrary to how you took my posts--I DO recognize you as an authority which has been around the block many more times than I), however, I have had that flashlight apart a half-dozen times, at least, it cannot be found!

But, it is quite possible the current limiter is right on the chip with the LEDS and potted with it in the LED lenses... all five LEDS run in parallel....

Warmest regards,
John

==========

If it was a fixed 1-to-1 transformer and one end was terminated with Zx, then the input impedance at the other end would also be fixed at Zx.

But it isn't!

By no stretch of the imagination is it a fixed voltage or current transformer of any sort.

By the way, a "Longitudinal current" is that which flows along the feedline when both wires are considered to be one wire. ie., when the wires are effectively connected in parallel with each other. It is that current which is measured by a clamp-on ammeter when clamped around both wires. The two wires can be coaxial or balanced-twin or open-wires. I've temporarily forgotten what US citizens call it.

Roy Lewallen, W7EL wrote:
"I don`t think that`s a valid excuse."

That old authors were satisfied with approximations may have less to do with ignorance than with not having computers and programs to make analysis fast and easy. The computer gurus have done well. A seconndary effect of a paucity of computer power is a requirement for more measurements. As the title of this thread is:"Accuracy of Antenna Testing Ranges". measurement is still a concern.

As one who was doing plenty of tests and measurements 50 years ago, I`d like to testify that if I could get 1-dB accuracy, I was satisfied. Bailey may not have thought that was good enough accuracy, but I think it was realistic for the period in the field. I`m sure the NBS did better. But for ordinary purposes. 1 dB is probably good enough for graphs and tables to be comparable in accuracy to the measurements you can make. Of course, everyone wants complete accuracy.

Richard Fry`s and Arnold Bailey`s tables were within 1-dB. I think it`s satisfactory.

Best regards, Richard Harrison, KB5WZI

There are various ways to get an atom`s orbital electrons to move to a higher energy level...

Your sentence, above, triggered some questions I have had in the back of my mind...
In older lasers, they were referred to as "pumps", and indeed the light souce always seemed to be "strobed."
I wonder if a LED is not "strobed", either occuring as a natural property of the LED itself, or circuitry incorporated on the LED chip, itself, which "strobes" it?
Mainly, I have considered the above in regards to wondering about giant sheets of polished aluminum, focusing the sun on a laser rod (or gas tube) and beaming the energy down to the planet (as has been proposed by others), and if someway to "strobe" the lightsouce would have to be devised? And, this in regards to the "pump"-ing action I have heard referenced... as, if I understand it correctly, you must kick (pump) the electrons up a level, then let them oscillate back to their original state, then kick-pump them again... as the actual light is generated by the electrons shifting states, and NOT just the fact that they are at another energy level...
It seemed to me the answer would be easy to find, from a search of the web... I was not successful...
Your thoughts/knowledge?

Regards,
John

Now, that got my attention. I haven't kept up well with LED technology, but I haven't heard of any LEDs that have a built-in regulator, switching or otherwise. Out of curiosity, I tested the LED lights I have with an AM radio, and found the following:

1. A three-LED headlamp with no obvious electronics, fixed intensity, runs from 3 AAA cells: Quiet, no RFI.
2. Two different LED headlamps, one with 3 and the other 4 LEDs, with several intensity settings, run from 3 AAA cells: Loud audio whine.
3. Two small UV LED lights, run from 3 button cells: Quiet, no RFI.
4. Newly purchased one-LED flashlight, runs from a single AA cell: Generates an RF hiss.

This is about what I expected. The #2 headlamps switch the lights on and off with varying duty cycle to get the different intensities. This can be seen by rapidly moving the light while on. The switching isn't visible at the maximum brightness setting but apparently the switcher is still on. It might be doubling as a regulator. High intensity LEDs seem to require about 4.5 volts for full brightness, and one cell is nowhere near enough to light one up without a DC-DC converter. So the #4 light has to have one. That explains its RFI. Built-in converters seem to be getting more common; without one, batteries last an incredible length of time, but at the expense of light intensity that falls dramatically as the battery discharges, especially during the first part of the discharge period.

So unless there's some sort of LED defect that can cause RF noise, my money's still on your having some kind of converter or switch hidden in your flashlight somewhere. All the lights I have which don't have either are quiet.

Dear all,

Mrs. yin,SV7DMC and Mr. pez,SV7BAX of TheDAG are strongly suggested your newsgroup, to ask for support, help, comments or opinions about antennas matters. A few days ago I made a post: "Naming an Antenna...". Fortunatelly, there were many replies and therefore I want to thank all of you for your time. In this post, I attach the following links in order to show you the geometry and the standing wave analysis of the prototype (?) antenna I want to examine theoritically and propably construct later.

geometry: (the antenna lies at the yoz plane)http://antennas.ee.duth.gr/recradioamateurantenna/dt/2005/hli/04/geo.jpg
standing wave analysis:
http://antennas.ee.duth.gr/recradioamateurantenna/dt/2005/hli/07/standing%20wave%20analysis2.gif

Thanks to the suggestion of Mr Reg Edwards I decided to name this antenna D-Dimond1 (ok, I changed the name he suggested a little bit). I would appreciate to look forward from you for any comments about the geometry or the name of this antenna. Also, once again; is this geometry or the name prototype?

Thank you in advance for your time

Dimitris

The LEDs may be pulsed by something resembling a square
wave duty cycle thus generating a host of harmonics.

It is for cases where Zx = Z0. The impedance seen looking
into my no-tuner feedline system is between 32+j0 ohms and
80+j0 ohms on all HF bands. On a couple of HF bands the
measured SWR is 1:1 and of course, under those conditions,
the impedance at both ends of the 1:1 balun/choke is fixed
at Zx = Z0 = 50 ohms.

What?!? Put all those manufacturers of accessories out of business?

What would we do without the cleaner for your CD's that makes them
sound better. A real product.

Or inch thick speaker cables between microscopic IC/Transistor/tube
wiring, and going to tiny speaker coils.

Interconnects cables made of both silver and copper wire to enhance
both low and high frequencies.

"Oxygen free" copper cables.

"directional" cables - hey, do these have a rectifier in them?

The list goes on and on...

The goofiest claims of some antenna manufacturers and affectionados are quite tame by comparison.

No, I stand by my definition: BALUN is a contraction of BALanced to
UNbalanced.

If you want to call it an impedance transformer, then call it a "BALUN
impedance transformer." The functions are independent. In fact, many
"broadband transformers" separate the functions into "balun" and
"transformer."

For example in Fig 2 of this reference:

http://www.minicircuits.com/appnote/howxfmerwork.pdf

>
>What is the transformation ratio of the W2DU "balun" and other devices
>which serve a similar purpose?

Let the complex line constant of the line comprising the balun be x =
alpha +j Beta .

Then with Zl being the load, the input Zin will be found from:

Zin = Zo * ((Zl + Zo *tanh(x))/(Zo + Zl *tanh(x))

Which of course for a lossless line of Zo and a load of Zl = Zo
reduces to Zin = Zl = 1:1

But you know all of this.

>Between which pair of impedances does it match?

It isn't designed to "match" anything. It's designed to suppress
common-mode current. Other than that, it's a length of transmission
line that behaves just like any other transmission line of the same
length, loss and impedance. But you know this too.

Hi Roy,

Constant current LEDs have been around since the late 70s. They were
marginally common then, but I rarely see them now.

As for the spectrum of LEDs, the all require different battery
voltages to bring them to full output. Light power is always
expressed as a function of current, not voltage however. The voltage
is somewhat likened to the forward conduction knee.

IR LEDs have the lowest knee voltage, roughly at the same potential as
common diodes: 0.6V. Blue LEDs have the highest knee voltage, roughly
3V to 3.5V. The colors Red, Orange, Yellow, Green, Aquamarine, Blue,
UV exhibit the order of ascending voltage (and in the conventional
order of wavelength for a rainbow). The White LED is simply a Blue or
UV LED coated with phosphor (a solid state fluorescent light).

>"strobes" it?

Hi Brett,

The voltage supplied to the LED elevates the electron out of one
orbital to the conduction band. When it falls back, a photon is
emitted. The wavelength of the emitted photon is the path length the
electron follows spiraling from one orbital to the other (DeBroglie
wave).

There are no lasers that are pumped in a cyclic sense except those
that emit a pulse like the old CO2 UV lasers. I had a buddy who built
one that used plate glass and aluminum foil to build the high voltage
charge used to excite the gas to lasing (you still need an optically
resonant chamber to build the intensity).

This design, from the pages of Scientific American's Amateur Scientist
column exhibited a very high peak power because of the extremely short
pulse duration. His knowing this instilled the caution to aim it out
the window into free space for its inaugural firing. When he pulsed
it he cracked the window. Window glass is not perfectly transmissive,
and the high peak power and short interval conspired to create a very
hot dislocality - the glass couldn't shed the heat fast enough and it
cracked.

I'm not sure if you could or would want to do this but could you use a
2m/70cm diplexer at the top of the tower.. single feedline to the diplexer
splitting out to one for each antenna?
might not be the best way but i should work. other wise i don't know how the
phasing would work with the two different freqs.

Phosphor? Wow, that fact had missed me totally...
The lifetime rating on those white LEDs are incredible!!!
From seeing crt tubes degrade over time, I'd expect there to be some sort of problem with the phosphor over such a long lifetime? A crt fails/dims due to air entering the tube, possibly?

The different languages "speak" to coders:
1) Assembly says, "All I know about is binary bits--if you can't twist your mind down strange directions you have not yet even imagined--don't bother me!"
2) Basic says, let's keep it simple, but, I pay attention to data types.
3) Fortran says, "I worship mathematicians--and stand as a tribute to them."
4) Pascal says, "I am structure, form, logic and beauty--if you come back months later, I stand as clear, sleek, fast and as beautiful as the code you first created (well, at least TurboPascal says all that <grin>)."
5) "C/C++" says, "I am all of the above--and MUCH, MUCH more, and like a spoiled child--you can have your way with me--take care in how you use me."

Actually, I think it's more of a quantum thing - a function of the band gap energy E, which is equal to hv (read h nu) where h is Planck's constant. Wavelenth is of course related to v by a constant, c (speed of light). Lambda = c/v. So wavelength = hc/E. If it was a DeBroglie thing, wavelength would depend on the momentum of the particle as h/p. The band gap energy is not determined by the energy carried by the particle, (or by the length of its path), but by the atomic nature of the material comprising the LED, and the difference in energy between the conduction band and the valence band of that material.

Let me give you my "Mental Model."

There is no such thing as "cold."
There is no such thing as "heat." (there is infrared radiation--i.e. a frequency(s) of vibration of atoms)
Cold is the absence of heat, absolute cold (absolute zero) is a single measurement of one state of heat (vibration/movement of atomic particles)--NONE!
Heat (hot) is really a measurement of the state of exicted atomic/sub-atomic particles movement, and of that movement producing "heat" through the friction produced by the movement of these atomic particles...

Next, there is no such thing as "time!" Time is simply a measurement of movement! Indeed, our time is based on the rotation of the sun and planets... (atomic time on the decay of a radioactive substance--but again, physical change and movement!)

I realize that specific "mental models" have been created, taught, adopted and followed (too religiously if you ask me!) for discussing and describing "radio." However, most of these are far from "real things!"

Warmest regards,
John

Hi Brett,

I've seen air enter the tube - perhaps, but there are more conventional explanations. Those episodes of "seeing" it enter were slightly less than catastrophic (accidentally broke the final seal, which, as it happens, is the right way to de-activate them). Principally it is the oxidation of the cathode (one reason why tubes have scavengers) from what air had remained from the production cycle.

Back when I did TV repair as a teen, and then later in the Navy as part of a Christmas charity project, we used what was called a "rejuvenator."

This piece of gear would apply several hundred to a thousand volts between the cathode and the first grid (usually a cylindrical shield capped with a plate with a pinhole in it) and hold the voltage there for a couple of seconds (manufacturer's recommended time). This would produce a current that would rip the surface of the cathode open revealing a new emitting area and the tube would come to life for another 6 months.

Well, during the extended project in the Navy, we found any number of tubes that refused this Lazarus treatment. We simply held the button down for 30-60 seconds as they sizzled. Who cared? It often convinced the tube that there was more to life than consignment to the dumpster (the guys loved to give them the heave-ho to thundering explosion). The only downside to this aggressive treatment was that in ripping open the surface, part of the current was a debris stream towards the grid that would occlude the pin hole. Sort of self defeating when you think about it (and good reason for the recommended couple of seconds instead of our heavy thumb).

All rather remote possibilities for the White LED. LEDs suffer other problems in commercial service. Usually with aging where the half-life is quicker than expected. Another problem is with what is called sun bleaching (usually the problem of LED traffic lights). I would suspect either, or both, to be issues with vendors and poor QA or selection. There are a world of "ultra-bright" specifications that wander the map.

funny story about that... i just got tasked to dig up the fortran code for a product my company is just thinking of upgrading to something more modern. they just finally ran up against windows xp that refuses to run the old dos extender the fortran was linked with... then it was wrapped with a windows gui that just ran the old fortran executable in the background. the gui will probably be more problems to update than the fortran if i can find the source... it uses visual c++ 1.52 i think, the last of the 16 bit windows compilers from ms.

Hi Jim,

The De Broglie [my spelling error] wave is a quantum thing.

In fact Louis de Brolie presented in 1924 that MATTER was composed of
discrete wavelengths (quanta). His was the identical treatment of
Einstein's proposition with light. Both he and Einstein had revealed
the duality of nature, and De Broglie's assertions were proven in
1927. The effect of his work left Schrodinger with the starting point
for his development of quantum mechanics.

Well, John,
If you put it thataway. Heat is an abstraction of movement. And time is
an abstraction of movement. Looks like the common thing here is ... lets see
... hmmm... abstractions ! couldn't be movement, cuz my dial don't move
anymore - the LED's just flash the numbers. Antenna length is an abstraction
of movement - the rate of movement (mhz) (megacycles per second) uhoh - I
can see a circular reference here --- if speed is rate of movement - then
rate has no meaning without including an element of time -- which is itself
an abstraction of movement.
move us toward a better understanding - lets do string theory next -
unless it moves, too.

There's a great deal of Fortran programming being done today -- the comp.lang.fortran newsgroup is very active. You're sure to be able to get some help with the Fortran there. Fortran has been standardized for a long time, and modern compilers handle legacy code, so it shouldn't be difficult to recompile the Fortran code with a modern compiler (e.g., Compaq, Intel, Lahey) either as an EXE or DLL to be run from the GUI of your choice. That's exactly what EZNEC does with the Fortran-compiled NEC code.

fortran is no problem, i have been doing that off and on since 1974 or so. the problem with this project will be locating all the source. it was done by various contractors who may not have submitted everything to our library way back whenever this was first done. i know that at least part of it was done with lahey tools so that shouldn't be a problem.

This is unfortunately an example of arriving at the right result by
using the wrong (actually, incomplete) method.

The field from a conductor is proportional not only to the current
flowing in it, but also the length of the conductor. So if you put the
same current into a dipole and monopole, and assuming they have the same
current distribution, the field from the dipole will be twice the field
from the monopole.

So let's start again. The input R of a monopole over an infinite perfect
ground is 1/2 the resistance of a free space dipole, so for a given
power input the monopole current is 1.414 times the dipole current, as
you said. Ok so far. But because the dipole is twice as long and with
the same current distribution (and oriented in such a way that the
fields from the two halves add in phase), the field from the dipole is
2/1.414 = 1.414 times the field from the monopole. However, each ray
from the monopole is reflected from ground, resulting in two rays adding
in phase at a distant point. This doubles the field from the monopole,
so it's now 2/1.414 = 1.414 times the field from the free space dipole.
This is the same result, but with the two additional important factors
of radiator length and ground reflection included.

A good check of the final result is to note that, neglecting loss, the
average field intensity from *any* antenna in free space has to be 3 dB
less than the average field intensity from *any* antenna over an
infinite ground plane, if the same power is applied to each. The reason
is simply that the supplied power is spread over half the volume when
the ground plane is present.

Roy Lewallen, W7EL

Richard is quite correct, tho to older hams, believe the
term he uses for "Scavengers", were called "GETTERS", and
were to claim any free gas's in a tube (this is anchient
history!). And, another method that was used , was an
"Extender", which was in reality, nothing more than a step-
up transformer for the filament, raiseing the voltage (and
hence the cathode temperature) by 1 to 2 tenths of a volt.
these were also (a variation of this principle) available
on telephone microwave carriers , where the klystrons cost
several hundreds of $$$. These, normally set the voltage
at 6.3 volts, but you could (at your own risk) turn it as
high as 7 volts. But, normally didn't exceed 6.5 volts.
and to give an idea just how prudent, the receive local
oscillators is some of that equipment, (according to the
date codes), lasted in excess of 20 YEARS continious service!
It wasn't the phospors that deteriorated, but the free
electrons that the cathode could radiate!
And, as a side note, Southern Pacific, found an outfit that
would replace the filiment/cathode and rebuild those same
klystrons , at about 1/4 the price of the new ones- the
original equipment was made by Lenkurt , about 1960 vintage
and only , about 8 years ago was finally retired, replaced
with solid state, mostly digital, but some analog equipment!
If this hasn't boored you by now, dont know what it will take!

As info, Jim NN7K (really dates me) !

It would be (and was often used to go from unbalanced to balanced,
or vice versa) , if the transformer was say , wound one to one , with
the primary, or secondary center tapped, the center tap connected to
one leg (perferably the "ground" side) of the other side of the
transformer. Could accomplish the same with a 110 volt to 220 volt,
center tapped xfmr, again tyeing the center tap to one side of the
primary (but for connection to your ac outlet, NOT the safest
construction proceedure! This was the tecknique used from 75 ohms
unbalanced to 600 ohm ballanced (tho obviously, the winding ratio
was different)! Jim NN7K

Yes, .dll libraries of functions/procedures is one answer to a few problems...
Most everything I write is a .dll... others do the GUI... I construct a simple command prompt front end to check and debug the code--then ship it off to others to do the "brain dead" GUI work...
I don't like visual IDE's (Independent Development Environments)... in fact, I don't like GUI's!!!
I am still pissed off everyone went from command prompt to GUI!!! It was a bad idea when apple innovated it--it was still a bad idea when bill stole it and copied it!!!

However, mp3 players, dvd players, etc running on computer platforms DO have advantages...

All my utilities/apps I write run from the command line (well, most.) If I am forced to construct a GUI, then I go directly to the winapi (you don't need a visual environment to construct windows and graphics!), calling the windows functions directly from my code, no third party tools (no click and create visual tools!)

Visual tools are not needed, windows contains all the code in .dll's already--to construct windows, msgbox'es, etc... why do I want to let another programmer translate for me--the winapi itself makes more sense!

But, Roy, Fortran is a dead language--even my beloved Pascal, which I hate to admit, is a dead language... with the power, speed and freedom of "C++" all other languages are obsolete (even assembly has fallen--just drop to inline assembly and write in assembly code) unless they run on minimal platforms (thin clients)...

I would like to say, "This is just my opinion." However, I will stand beside this as being fact... <frown>

You're very wrong about that. Fortran is in wide daily use, with a great deal of active programming going on. The main users are academic, scientific community, and the military. Compilers are modern and continue to be updated. The language itself undergoes periodic revisions and updates via a standards committee. It's an evolving, modern, active language. Drop by comp.lang.fortran or do a little basic web research and see for yourself.

Well, I disagree...
We often ship a project out of house for coding, we don't care what language the coder creates in...
the "#define" statement is VERY powerful in "C"... with it, we have created headers in BASIC, Pascal, Fortran, etc... and defined the WHOLE LANGUAGE to call C functions in place of those of the native language (there are also translaters which translate any souce to C source, and these are generally used in place of the headers, as documentation in C is produced at the same time)...
Although the programmer is creating in another language, it compiles on a "C compiler."
Now and then, to keep fluent in Pascal, I use one of these headers, I write in Pascal--and a C compiler builds the object code...

New Jr. programmers used to come in fluent in other languages other than "C"--this was all designed to allow them to be productive from day one--while they came up to speed in C.

Now, C programmers are common, and I don't remember when this was last used...

Now, most of our code is being done off shore... the world is VERY C savvy!

Well, the illusion called time is useful in physics, navigation, etc. It gives some people something to sell.

Man has struggled desperately to measure time sccurately through much of history.

The cesium beam atomic clock is about the best standard now. First produced by the U.S. NIST in 1952 as NBS-1.

England`s National Physical Laboratory atomic clock is accurate to one second in 1000 years.

Dear Dimitris or "superas_1988"

See earlier message below. Names are good, but the antenna is not
completely specified.

Dear "superas-1988" (presumably in Greece)
It appears from the drawing that the antenna is a wire antenna with all
wires in the Y-Z plane. It is likely that the portion above the driven
dipole is a mirror image of the portion below the driven dipole. Each
dipole has the same length and that length is specified as 0.5 WL.
Questions:
1. Is the above true?
2. What is the included angle between the driven dipole and the dipole to
its right and above? It looks as if that angle is near 55 degrees.
3. Is the length of each dipole a physical 0.5 WL or an electrical 0.5
WL?
4. What is the nature of your interest? A school project? A radio
amateur's project?
5. Is the antenna intended to be used at HF? If so, how high do you
consider the driven element to be above the earth's surface?

Wes Stewart, N7WS wrote:
"Do not no.."

6-ft seems sufficient separation at 2-meters or 70-cm to avoid tight coupling.

First MW BC plant I worked in was in 1949. It had stations at 950 KHz and 1320 KHz. Both stations used the same antenna tower. Pass / reject filters kept them out of each other`s final amplifiers.

I think in the VHF / UHF range one might get lucky and select the right length of coax between an individual antenna and the common feed point where individual antennas are paralleled and make the antenna at that point look like a high imprdance to the wrong transmitter. For practical purposes the wrong antenna disappears, but the right antenna does not. It matches the coax.

Best regards, Richard Harrison, KB5WZI

The basic design was well founded, and based upon need and usefullness,
unlike some following languages such as Ada and Pascal.

I wrote my first programs in Fortran II, which ran on a very small 360.

>
> With a 3m chamber, anything greater than 12" is not really practical.

Well, that's kind of what I was trying to say. The right way to do the work is to start with the size of the device you need to test, then consider the test standard that you need to apply, and that will tell you how much "working volume" you need inside the chamber. Then, you can decide on anechoic treatments, and that then defines the size of the shielded chamber. This "working outward" approach is the right way, but if you find that you have now specified a 30' high by 50' wide by 100' long chamber, likely you can't afford that much "goodness." <g>

Most people find themselves in a situation where they have a chamber of some kind, and then they are challenged to do good work on a product inside that volume. Sometimes you can do "good enough" work, with a lot of effort and some known limitations. Sometimes what you do is pretty decent, and good enough for "pre-compliance" requirements. If your product line is rather consistent (size, peripherals, external cabling), you can often use data from a fancy, fully capable lab and compare that with data generated in your own limited facility. When you find the deviations, you can use those as future "correction factors."

Again, the 250 MHz verification of return loss is measured with a horn
antenna, typically a double-ridged model like the ARA 2020 or the EMCO 3106.

Before I installed the ferrite floor tiles, I had considerable problems with
resonances, starting around 7 MHz and continuing through about 150 MHz,
associated with the chamber XYZ dimensions. After the ferrite installation,
the resonances have nearly disappeared.

Last night I had a dream...

I snuck out to investigate a large and strange building on the outskirts of the city, this building covered four city blocks!
When I peeked in one window, I seen two vaccume tubes, each was the size of house!
The window was cracked, though the crack I overheard two engineers talking, one must have been new, as the other was explaining to him that the equip was a 100 megawatt xmitter! It was a 60 cycle transmitter. He pointed to the rear of the tubes, at a LARGE balun which fed lines leaving the building. He explained that the balun was properly loaded when a certain voltage was on the plates, and there was a large, variable dummy load which controlled the voltage on the plates, and that the input power could also be varied, as this xmitter was used as a "constant voltage souce."
The lines which left the building went to supply homes with the transmitter power. At each home the power was consumed by many individual "baluns", which matched the impedance of the line to a device on the secondary of the balun. Also, many dummy loads (light bulb, resistance heating devices, etc.) existed in these homes. And, there were even devices who's impedance matched that of the lines directly, but contained additional resistance to limit the current they consumed...

Then I woke up!!! <grin>

John

Reg:

I'm primarily doing the US MIL-STD-461E protocol, on widely varying test specimens (hand-held, man-worn, 2-meter tall racks, 2-meter diameter parabolic tracking antennas), so I am getting my antennas calibrated for 1 & 3 meter separation distances.

The lab I use has an outdoor range, and I get a Certificate of Conformance for each antenna which includes the following statements:

"Test and Measurement Equipment used for performance verification is calibrated with traceability to the U.S. National Institute of Standards and Technology. Inspection records, test data, and other evidence of conformance

are on file at the sellers facility are are available for inspection on request."

They further state a "Calibration Uncertainty of (2 sigma) (+/- 1 dB)" and reference "SAE ARP-958". I then get a listing of the specific instruments used in the generation of my antenna data, along with their calibration certificate numbers and the date of each calibration period expiration.

As for the data, I get a tabulation and a plot. For a typical antenna (an EMCO 3115 double-ridged horn covering 1 GHz to 18 GHz), I get a tabular array of antenna correction factor, dB return loss, SWR, numeric gain and dBi, in 250 MHz step increments, across the range. I also get a continuous swept plot of return loss, and from this, I infer that the lab uses my unknown antenna as the transmitting element on their range.

This data and the C of C is enough to keep my internal Metrology guy happy, and it gives me a sufficiently warm feeling. I have been using the same antenna lab for almost 10 years, and I informally track the calibration data from year to year on each of my antennas. So far, the data never has looked "copied", fudged, or otherwise egregious. However, that may just mean I'm easily fooled.

"Balun" is a contraction for "balanced-to-unbalanced". It converts an unbalanced drive source (such as a grounded coaxial feed) into a differential drive drive source that is completely floating with respect to ground or any other common point.

Even if there were such a thing as the 'ether' (there isn't; elecromagnetic waves don't need a medium to propagate), your antenna would not be classified as a 'balun' just because it transforms your electrical feed into electromagnetic waves. It would more accurately be called a 'transducer' because it transforms energy from one form (electrical) to another form (electromagnetic). One of the characteristics of a transducer is that it has input coupling properties as well as output coupling properties, so in this respect part of your statement is sort of accurate - the part about impedance matching.

If one just takes existence at face value, one lives closer
to that which actually exists. Time, like language, may
be just a human characteristic. Ever try to talk about
time without using time-sensitive words, e.g. the tenses
of verbs? :-)

Hi John,

You are thinking too much.

You sound clinically obsessive/manic in your overly expansive ideations that you appear to (truly) believe are NOT overly expansive at all, but rather are incredibly brilliant insights, or observations and ideas, that you feel absolutely MUST be shared with all of us --- immediately. The basis for that type of behavior has been studied and written about more than, dare I say, even the Balun. Take a break from it all. Stop talking to US about these things, because we aren't the ones you need. Talk to someone one-on-one that can help you out.

Regards,
--- Rob

Precisely 4.5 billion years ago. :-) Strange as it may seem,
there is evidence, gathered by comparing Bristlecone Pine
rings to atomic dating methods, that a second today is
shorter than a second was yesterday. Shortening the length
of a second gives a whole new meaning to the Red Shift.

It probably took more than a hair from the Big Bang until the
first hydrogen atom formed and some time from that point until
the first star ignited. And the entire universe was opaque
until Mother Nature said, "Let there be light!" :-)

That's exactly what I am saying, Reg. Before man, the
universe got along just fine without the existence of
time. Why does the universe need time now that we are
here?

Actually they do. It is generally accepted that EM waves
cannot propagate outside of the universe precisely because
of the absence of any structure (medium). Our medium of
space is thought to have at least ten dimensions.

"John" always gets prompt responses to his (her) posts....even if he
(she) has to do it him(her)self.

That's why he (she) often doesn't include any quoted text. He (she)
knows what he (she) said, so why bother repeating him(her)self?

Hi Ed,

When I was in the Navy, my buddy had, in his former life, been a pipe organ technician (the old fashion type, not the Hammond home organ type). He had worked in the really large Pizza 'n' Pipes types of concessions up and down the Pacific coast, and in the classic theaters of the 30s vintage (Paramounts, Pantages, Orpheums, etc.). He related how those venues made sure that when constructed, no two walls met at 90ï¿½ nor were parallel so as to break up resonances.

I don't think it is that simple, I think every change causes complex reactions--more than one varible starts moving on the map. For example, a change which affects a "match", affects a reactance, affects apparent impedance, etc. Too many times, at least a newbie like me, expects only one varible to change--when in reality--it is "looking" like EVERYTHING is moving!!!

And, I do suspect an ant can be "mentally modeled" as a balun--and sucessfully delt with. I think current models are followed, mainly, because of tradition--there are other ways to view this. "Impedance" looks a bit like "time" to me.

But, right now that is just a "theory", but I will be playing around with that idea...

Regards,
John

Yes Cecil, I concede your point, just poking a bit of fun--I am sure your explanation is just as possible, if not more possible...

However, back then, God was probably measuring time in "universe creations!" If you think about it, in such a time frame "hair" may be an accurate description... <grin>

But, I am not sure the big bang only left free neutrons and electrons (which had to form atoms)--I was thinking more "whole atoms" of some type...

Warmest regards,

John

Let me give a more understandable example of the above... (and yes, this DOES involve fantasy!)
If a fish leaps out of water, after effortless traversing the water (such as we do the air), it appears to the fish that air is "space", i.e., the absence of ALL matter... they, most likely, view us as "planetary bodies!" We, being the fishes "Gods", know better... <grin>

I have heard it given as, "speed of light times mu naught."

However, I have not examined proof of this, and actually, that is claimed to be the impedance of space itself (a vacuum), "air" maybe slight different. Anyway, I adopted it simply because it seems to be accepted--do a "google search" with the search terms:
[impedance either 377 ohms]
You will either find your proofs there, or not....

Warmest regards,
John

I dunno, but doesn't this bring up 'particle theory vs wave theory'
waves require a medium to propogate (I would think) - and -
particles can be shot across a medium-less void
Maybe this will all go back to the 'previous discussion' ain't no such thing
as heat
and no such thing as time - and therefore anything else defined by using
either of those terms do not exist either.

So are you saying that - in theory - that a balun (or un-un) (or lets just
say "An impedence matching device") can serve to propogate RF into the
'ether' (free space) ?
Did you try it out in practice - to see if it works ?
What's the impedence of 'ether' ? didn't you mention something around
300-400 ohms ? If so was that at all freqs?

| Let me give a more understandable example of the above... (and yes, this
| DOES involve fantasy!)
| If a fish leaps out of water, after effortless traversing the water (such
as
| we do the air), it appears to the fish that air is "space", i.e., the
| absence of ALL matter... they, most likely, view us as "planetary bodies!"
| We, being the fishes "Gods", know better... <grin>
|
| Warmest regards,
| John
|

| news:dmPce.204$Nz2.7298145@news.sisna.com...
|| Ahhh, you open up yet another can of worms here Cecil.
||
|| Most don't believe in "space" (darn commie buggers probably don't believe
| in
|| Santa Claus either!) and simply consider it the absence of ALL "matter."
|| However, I think it is now also generally accepted, all the matter in the
|| universe was/is "ripped" (big bang?) from the very fabric of
space--i.e.,
|| space existing in an "altered form."
|| Although, we effortlessly travel through it (in our "altered state of
|| being") it does have form and structure--simply one which is invisible
and
|| undetectable to us mere mortals...
||
|| Warmest regards,
|| John
||
||

I just am going on others work? beliefs? fantasies? as to the impedance of space being 377 ohms, a google search will provide you with examples of the material I viewed...
use the search terms:
["377 ohms" either site:edu] <<== DO NOT include the square bracktes--it will only return papers, docs, etc. from universities (site:edu does the limiting, being interpreted by google as a command of, "Show me ONLY papers from universities/"educational institutions"--and, NOTE the colon between "site" and "edu".)

Yes, I am so bold and ignorant as that!!!

I am beginng to view "space" not as "nothing" but as real a conductor as the feedline to my antenna--it being (space) a feedline completly surrounding and physically connected to my antenna (omnidirectional--balun/UnUn), and therefore conducting my rf away in an omnidirectional pattern, unless I substitute a beam (or other "directional antenna") which "blocks" or "impedes" this "contact" to the either in one or more directions...

Why, do you think it is time (well, "time" is NOT real--so a silly question) I should check in for a three-day mental observation?
<grinning-like-a-damn-fool>

Warmest regards,
John

==========

Life forms which think can have any number of dimensions.
Physical size is unrestricted. From quantum size upwards.

They are as fully equipped to handle their environments as humans are
equipped to handle theirs. Otherwise they wouldn't be there.

There's no reason why thinking life forms should not be as large as
the Galaxies or even Groups of Galaxies.

Groups of Galaxies have more than one head. Inevitably they are
exceedingly slow thinkers when measured in our time scales.

On the other hand, they have the Whole of Eternity in which to solve
their problems, dragging us puny insignificant creatures along with
them for one short microscopic period.

As experienced on this tiny Earth, they appear to be suffering from
epileptic fits at this moment in time.

Elementary Statistics should be the 4th most important subject taught
in our schools after reading, writing and doing sums.

Kids should be able to estimate the probabilty of being run over by a
bus when they cross a busy street.

Hope you get the drift of my thoughts before returning to the TLI.

Source record: 78049

At this time, I think it is important to interject the following, and clarify my position:

I value GREATLY the men and women (even the ITs) who have gone before me.

They have laid a good foundation and provided me with tools of which a value cannot be placed--knowledge is priceless...

And, I would always explain (with my limited abilities) the concepts which provide a "language" so we can all communicate, effectively, on the subject of radio and its' affects/effects... I respect the right of "impedance", "reactance" and such to exist in concept... (even time--although I wish we thought in terms of "Earth Revolutions" and fractions thereof; even the concept of cold I can accept <grin>)

The forefathers of radio are at least as great as those forefathers of our nation.

I would give all I own to have stood beside such men as Benjamin Franklin, Nicola Tesla, Faraday, Armstrong, Deforest, etc... I am born too late for anything so exciting--I only hope the future has such moments left... I think it does (in fact, I "religiously" believe!)...

So, now those who would denounce me as a "Rebellious Idiot" should be quieted (well, somewhat)!!! I am NOT rebellious!!!

<grin>

Warmest regards,
John

"John Smith" <assemblywizard@gmail.com> wrote in message
news:hBwce.68$3M3.4274209@news.sisna.com...
| Let me give you my "Mental Model."
|
| There is no such thing as "cold."
| There is no such thing as "heat." (there is infrared radiation--i.e. a
| frequency(s) of vibration of atoms)
| Cold is the absence of heat, absolute cold (absolute zero) is a single
| measurement of one state of heat (vibration/movement of atomic
| particles)--NONE!
| Heat (hot) is really a measurement of the state of exicted
atomic/sub-atomic
| particles movement, and of that movement producing "heat" through the
| friction produced by the movement of these atomic particles...
|
| Next, there is no such thing as "time!" Time is simply a measurement of

| movement! Indeed, our time is based on the rotation of the sun and
| planets... (atomic time on the decay of a radioactive substance--but
again,
| physical change and movement!)
|
| I realize that specific "mental models" have been created, taught, adopted
| and followed (too religiously if you ask me!) for discussing and
describing
| "radio." However, most of these are far from "real things!"
|
| Warmest regards,
| John

From my email being filled with email which blesses my rants--and even those sending the "death threats" which are SO appreciated (and your numbers are IMPRESSIVE!!!),
it has come to my attention that you may be reading these rants on "webpages", and "newsgroup collections", and NOT real news groups. (this is the reason some of you are asking me to include quoted text in my postings--most likely!)

If so, come join us here in the "real" world.... it will be much more satisfying to threaten to kill me in a public forum, as opposed to an email.... and you may find friends here!!! (some of these guys look at me with a evil glint in their eye... <grin>)
Here is a webpage which will provide you with a free news server:
http://freenews.maxbaud.net/
Simply do a search and find a news server which provides the news thread you wish.
I'd suggest you make sure it provides "posting ability" and NOT just reading ability (otherwise, you will NOT have the ability to construct and send that cherished "death threat"), and sign up...
If you need more help, you should have my email (if not, I have included it below my signature)--I can tell from all these "death threats"--I do SO ENJOY reading!!!

OK. Maybe I exaggerated, and there are no "death threats", and only emails questioning my sanity and right to exist (or think!)... <grin>

NOTE:
... even if you have an existing news server, you can still pick up another there--so you can post anonymously!!!
Personally, I would recommend "news.excelonline.com" (you can enter that directly into your newsreader)... there are others just as good/better? on the page I mentioned...

Warmest regards,
John

Reports of Fortrans demise are greatly exxagerated. Dead since the late
70's, but still in use.

There wasn't "that much space" back then. I forget how big
the Big Bang source space was, but it was extremely small
compared to the present universe and therefore extremely hot.
Incidentally, our "laws" of physics don't work until some
time after the Big Bang.

It is an interesting question. Certainly life forms that presumably do *not* have consciousness, such as bacteria, have a beginning, a being and an end. So is time dependent upon a life form possessing sentience? If a sentient being such as man is not there to invent the concept of time, do all those constructs that have a beginning and end cease to exist?

> A year is
> simply movement, once around the sun. I've been
> here for about 40 billion miles around the sun. Is
> that time or simply distance?

Years are constructs of humanity. It is simply a convenient method of marking things that *happen*, such as the position of the stars, which as it turns out , is a manifestation of the period in which the earth returns to some initial observation point.

No doubt it is similar to our using base 10 math because we happen to have 10 fingers.

> Am I winding down
> because of the years or simply, like my '96 pickup,
> because of the miles?

Entropy, My dear Cecil, entropy!

More importantly, as the great sage Homer Simpson asked:

"Can God make a burrito so hot that he can't eat it?"

A great mystery for sure. I think that the beginning-being-end of things - as related to the experience of humanity - makes for a necessary concept. That would be time.

At least in this existence, we have a finite appearance. So time is very real. Here.

I had the great fortune of attending a talk given by a paleontologist, in which he noted that microgrowth rings of fossil shells do indeed show that the day length has indeed shortened. Although he was careful not to draw any definitive conclusions - yet - it was apparent that due to the changes in the Earth's orbit over time were giving rise to changes in the length of the solar day, which in turn end up changing the length of all the units that we use to measure time.

That time occurs is not all that arguable to me. Our measurements of it is a modifiable thing tho'.

I wanted to respond to this right away--your post... but was quite simply unable.... (I literally spent time starring out a window!)
Realize that I have nothing but questions about the "end of the universe", I think it is like that for us all, but, maybe not....
I suspect it to be a sphere, but you have seen the "mobius strip", it at first looks quite innocently like a two dimensional object, on closer examination, IT ONLY HAS ONE SIDE!!!!
The universe could very well be like that...
My mind spends a lot of time "out there" when I am slow to sleep....

I imagine most are scarred to speculate--others would probably mock their efforts....

Any ideas, or models which you can find to build a "mental model" from?

Warmest regards,
John

It's even more complicated than that. When a bacteria divides,
the two resulting individuals are identical, not parent and
child. So, barring mutations, any bacteria that is not extinct
is immortal. Time is absolutely meaningless to such an organism.

Try assuming that time doesn't exist and you are keeping track
of change referenced to the rotation of the earth on its axis
plus earth's orbit around the sun. What is different?

The existence of time is not necessary for that function.
A mechanical device synchronized to the roatation of the
earth on its axis can do that. A piece of paper marking
4/1461 of the earth's orbit around the sun can keep track
of days of one year. Or just make a mark every time the
sun rises.

I have thought of this... don't laugh... but your thoughts are welcomed...

After the big bang, I am assuming (I know, that's bad) that somewhere, just by the design of "probability laws", that a pulsar was able to form, rather quickly (few billion years?)--and began emitting...

If so, why have we NOT heard a bounce from the "shielding" (end of the universe)?

Is it constructed of radio absorbing material?

Does it "go" somewhere else?

<Imagining-God-sitting-at-a-receiver-as-the-signals-reach-heaven-thinking, "noisy little universe and creatures--ain't they?>

Regards,
John

"John Smith" <assemblywizard@gmail.com> wrote in message news:GPXce.272$_M6.9723016@news.sisna.com...
|I wanted to respond to this right away--your post... but was quite simply
| unable.... (I literally spent time starring out a window!)
| Realize that I have nothing but questions about the "end of the universe",
I
| think it is like that for us all, but, maybe not....
| I suspect it to be a sphere, but you have seen the "mobius strip", it at
| first looks quite innocently like a two dimensional object, on closer
| examination, IT ONLY HAS ONE SIDE!!!!
| The universe could very well be like that...
| My mind spends a lot of time "out there" when I am slow to sleep....
|
| I imagine most are scarred to speculate--others would probably mock their
| efforts....
|
| Any ideas, or models which you can find to build a "mental model" from?
|
| Warmest regards,
| John

1812. GAP Eagle DX-VI manual

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-01 06:04:20 UTC
From: Chris Edmondson <chris.e@swiftdsl.com.au>
Message-ID: <BE9AAE84.2C80B%chris.e@swiftdsl.com.au>
Source record: 77977

G'Day from Downunder!

I purchased a nice new GAP Eagle DX-VI a couple of years ago for my new house, so before the move I opened up the crate and read all the instructions.

You know what happened, don't you.... In the move I LOST the rotten manual, and I'm left with an antenna which hasn't yet been erected. I'm really eager to put it up but the retailer from whom I bought the thing is no longer in business.

I've tried without success to find a PDF version of the manual. Can anyone help please?

73 Chris Edmondson, VK4AA and VK3CE

Indiglo uses an electroluminescent panel that's powered by an inverter.
It takes something like 100V to light it. It's probably the inverter
that's causing the RFI.

Mine has always been "Flatland". It helps to understand that
we are trapped on this three dimensional surface and have
difficulty comprehending where we would be if we could leave
it behind.

The edge of the universe is more than 12.5 billion light years
away, beyond our visible horizon. The early inflationary period
caused the expansion of space to outrun the speed of light.
Maybe in another 20 billion years, we will hear the bounce.

Portions of this universe are over 100 billion years old--that translates directly to 100 billion light years... that is a lot of distance... even thought the echo of the big bang itself may have subsided, I just cannot believe we can't hear bounces of other signals (signals which cannot be accounted for)...

Warmest regards,
John

Dear John,

The essence of Life is Change.

The essence of Change is Time.

Without Time there is no Change - without Change there is no Life.

Without time, the existence of that entity or "Geist" that could
imagine a concept of "Time" could not exist.

Therefore, Time might well be the most fundamental of fundamentals.

How is it possible for portions of this universe to be
eight times older than the Big Bang which occurred
about 12.5 billion years ago?

Can you define "changes" without reference to time?

1830. Good morning or good evening depending upon your location. I want to ask you the most important question of your life. Your joy or sorrow for all eternity depends upon your answer. The question is: Are you saved? It is not a question of how good you are, nor if you are a church member, but are you saved? Are you sure you will go to Heaven when you die? GOOGLE·NEWSGROUP·POST·154

Newsgroup: rec.radio.amateur.antenna

This is the most important question of your life.

The question is: Are you saved?

It is not a question of how good you are,
nor if you are a church member, but are you saved?

Are you sure you will go to Heaven when you die?

The reason some people don't know for sure if they
are going to Heaven when they die is because they
just don't know.

The good news is that you can know for sure that
you are going to Heaven.

The Holy Bible describes Heaven as a beautiful
place with no death, sorrow, sickness or pain.

God tells us in the Holy Bible how simple it is
to be saved so that we can live forever with Him
in Heaven.

"For if you confess with your mouth Jesus is Lord
and believe in your heart that God raised Him from
the dead, you WILL BE SAVED." (Romans 10:9)

Over 2000 years ago God came from Heaven to earth
in the person of Jesus Christ to shed His blood
and die on a cross to pay our sin debt in full.

Jesus Christ was born in Israel supernaturally to
a virgin Jewish woman named Mary and lived a sinless
life for thirty-three years.

At the age of thirty-three Jesus was scourged and
had a crown of thorns pressed onto His head then
Jesus was crucified.

Three days after Jesus died on a cross and was
placed in a grave Jesus rose from the dead as Jesus

said would happen before Jesus died.

If someone tells you that they are going to die and then three days later come back to life and it actually happens then this person must be the real deal.

Jesus Christ is the only person that ever lived a perfect sinless life.

This is why Jesus is able to cover our sins(misdeeds) with His own blood because Jesus is sinless.

The Holy Bible says, "In Him(Jesus) we have redemption through His blood, the forgiveness of sins..." (Ephesians 1:7)

If you would like God to forgive you of your past, present and future sins just ask Jesus Christ to be your Lord and Saviour.

It doesn't matter how old you are or how many bad things that you have done in your life including lying and stealing all the way up to murder.

Just pray the prayer below with your mouth and mean it from your heart and God will hear you and save you.

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven with You when I die. I agree with You that I am a sinner. I believe that You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins and that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thanks Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

Welcome to the family of God if you just allowed God to save you.

Now you are a real Christian and you can know for sure that you will live in Heaven forever when this life comes to an end.

As a child of God we are to avoid sin(wrongdoing), but if you do sin the Holy Bible says, "My dear children, I write this to you so that you will not sin. But if anybody does sin, we have one who speaks to the Father in our defense Jesus Christ, the Righteous One."

Those of you that have not yet decided to place your trust in the Lord Jesus Christ may never get another

chance to do so because you do not know when you
will die.

Jesus said, "I am the way, the truth and the life:
no one can come to the Father(God)(in Heaven), but
by me." (John 14:6)

This means that if you die without trusting in Jesus
Christ as your Lord and Saviour you will die in your
sins and be forever separated from the love of God in
a place called Hell.

The Holy Bible descibes Hell as a place of eternal
torment, suffering, pain and agony for all those who
have rejected Jesus Christ.

The good news is that you can avoid Hell by allowing
Jesus Christ to save you today. Only then will you
have true peace in your life knowing that no matter
what happens you are on your way to Heaven.

Praise the Lord!
Servant of the Lord Jesus Christ

Well, you make an excellent argument, and you are certainly correct that "time" is a fairy tale that we can use to good advantage, and we are better off for being "fools" and believing in the "myth"--it benefits us, and if we don't look too hard, it appears "REAL"--but "time" is NOT real...
Change is movement--and movement is what "time" was constructed to record... and the earths movement is all it ever recorded (well, heavenly bodies, pick one, you can use "that" one too.)
Time in a bottle would be the earth rotating, or a bit of radioactive loosing atomic particles, and a little man counting the number of them lost...

Warmest regards,
John

What sort of circuit is it in?
Between what things is it to be used?
What frequency range?
We are not mind readers!

Without further information try 12 turns of Radio Shack, 18 or
16-gauge, twin, stranded, speaker wire. It might work.

Errr, impedance of the winding should be "inductive reactance"--excuse me, these "unreal" things are confusing to me... <grin>

here is an piece I got somewhere I have been using with tollerable results...
CALCULATING THE TURNS COUNT

Lets calculate the turns count for impedance matching a beverage antenna with an impedance of 450 ohms to 50 ohm coax. Because this is a step-down transformer, the primary (attached to the antenna) will be the larger winding and we'll deal with that first.

The first formula to use will give us the desired inductance of the primary winding:

desired L of winding = XL/2p&#65533;

where L= Inductance in millihenries XL=Reactance in ohms &#65533;=Lowest frequency of operation in kHz

XL may be found by multiplying the impedance of the antenna to be matched by a factor of 4. This XL would be

4 x 450 ohms or 1800 ohms. To make things easy, lets use 500 kHz. as our lowest frequency of operation.

So, L of the primary winding = 1800/2 x3.1416 x 500 or .573 mH

Now that we know the inductance (L) needed for the primary winding, we can apply the following formula to determine the number of turns needed for the primary winding.

N = 1000 &#65533;L/AL

In narrative, this formula should be read: Number of turns required (N) is equal to 1000 times the

square root (&#65533;) of the Inductance (L) divided by the constant AL.

The constant AL is determined from the Amidon technical literature and takes into account the RF qualities and the size of a Type 43 toroid that is 1.14 inches in diameter. The AL for the FT-114-43 is 603.

So, working the formula above, N = 1000 &#65533;.573/603 = 1000 x .030825 = 30.8 turns, use 31

"Optimum" depends on the frequency or frequencies of operation and on the antenna system. What you need to do is go to the Micrometals web site (Micrometals is probably the manufacturer of the core) and find the inductance per turn squared of the core. Then you can calculate the number of turns needed to get the required reactance at the operating frequency. For nominally matched antennas, an impedance of 500 - 1000 ohms is generally adequate.

You might find you'll have trouble getting enough impedance at the lower HF bands. Powdered iron is usually a poor choice for a balun core because of its low impedance per turn squared. You might pass the self resonant frequency by the time you get as much reactance as you want. Ferrites such as type 43 are usually a much better choice -- you get much more impedance, it stays relatively constant over a very wide frequency range, and you'll be free of resonance effects.

one more thing, in most cases, "wire size" should always be the largest you can get away with (have handy, etc)--not only is it more efficient (lower ohmic loss of power) it usually holds form better... I would not be all that concerned about capacitance between turns--unless for very high freq use...

Regards,
John

How would they exist? Unless the observer were incredibly dense, it would be noted that the stars or position of the sun, or whatever they based their degree system on - would return to something that looked a lot like an earlier state.

It is difficult to imagine how mortal, intelligent creatures would not develop a concept of time. The concept (reality?) seems ingrained in almost everything we do, say, or think.

I missed that!!!
Where is the 12.5 billion year age of the universe given, I will recheck,
but the universe is much older...
You sure that is not the age of our galaxy?

Regards,
John

Never mind, while I see the "proof", and this page:
http://www.astro.ucla.edu/~wright/age.html
seems to suggest 10-20 billion years old--that seems wrong to me--but that is a lot of information to digest, and I don't want to be drug away from other pursuits at this moment...
But, it looks like I will have to stand corrected for now... sorry if my error in "time" (hey, it ain't real anyway <grin>) caused any grief...

Warmest regards,
John

=====================================

Some buried wires under a horizontal dipole, at a height of 1/4 or 1/2 wavelengths, will, in theory, reduce losses. Some old wife, once upon a time, must have read something about it in a book without bothering about the magnitude of the effect.

It's not enough to be detectable. So don't listen to your voices or waste time digging up your back yard and getting back ache.

There's far too much of old wives reading things in books and ill-written radio magazines, getting the wrong ideas, and then plagiarising them. Which innocent people hear about 3rd or 4th hand or n'th hand.

The fabled SWR meter is another example.

Reg.

Reg:

Yes, I have, started winding 'em with too BIG of wire to, had to drop a
couple sizes... which is why I said:
"...should always be the largest you can get away with...", as to "wire
size."
A 2" core is pretty big though, that is what he has got-if I know those
numbers correctly, and unless he is going to the basement (160M) or a KW
(probably could get by with a KW on a 200A too, but I'd go 2.5" core) he has
some room...
It is a 200A, they have a bit more inductance per turn too (bit fewer turns
for same mh/uh), than just a 200, if I remember datasheets correctly...

Warmest regards,
John

That is a 1/4 wave antenna you have us looking at, a ground plane with
drooping radials--right?

If you are just going to use it in a house, why not do a folded dipole out
of 300 twin lead--with matching circuit, or j-pole?

But, I am assuming (I know that's bad) it is low power and short distance,
OR, are you going to try to cover your city? State?

Radio Shack sells a wire folded dipole for FM for less than 5 dollars.
You might also need an adaptor to convert the 300-ohm line to coax for
your transmitter.

Tack your dipole to a wall or board, and you're ready to
transmit...legally, I presume.

I too used a NF-105 with plug-in modules and a gas generator to run
propagation surveys in the hills of West Va. a very long time ago. I
received a first class education about real propagation and comparisons with
predictions. Sure wish I had had a computer.
Since we had a government station wagon (would drop off the generator,
drive ahead to get away from the noise, and take measurements) we were
concerned that the indigenous population might see us as "revenuers." We
never went up a road that had an advertisement for honey.

Reg:

You know about SWR meters, built any?
I have built one, two so-239's, center conductor between 'em has a toroid with 20 turns, EACH SIDE of the winding on the toroid has a 50 ohm resistor to ground AND cathode of a diode to it, EACH SIDE through the diode feeds a bright LED, and BOTH LEDS share a common ground resistance (variable)... (cap to drain off rf to ground and supply a dc voltage/current in diodes circuits) one LED reads forward, other reads reverse... it "seems" to work, but here everything seems to be as real as "time."
In use, I adjust the forward LED for approx. correct brightness, the rev LED is "judged" in brightness to make a workable guess at SWR... (I have one with a meter--different direction coupler design, I just get a kick out of the leds... I built the one with the meter, it "probably" works correctly <grin>)
Operation has been at 100 watts... and, I don't think it would take anymore power, barely able to dim the led near/at dark condition now (but this make it highly useable at 10 watts)... probably have to drop secondary turns on the toroid (but, how many turns would I need to keep to assure accurate operation of the directional coupler?) and/or supply voltage to the leds though a resistive divider, if I went more power...

Is my "directional coupler" design correct?
Better ideas for this circuit?

Warmest regards,
John

#2 material is a good choice for inductors, not so good a choice
for a balun. I bought a commercial balun made from #2 material.
It did not perform well over all of HF. #2 is powdered iron.
Suggest a ferrite like FT-240-61 or a W2DU style choke.

Legally of course!
We received the "Whole House Transmitter" (
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5769831721&category=73836
) it's ok for about 50ft 'cuz of the obstructions.
She likes it and now.. she wants me to transmit to the community pool so she
can hear "her tunes" (about 2/3's of a mile away).
I also have a small, 1 watt signal power booster(?) kit on order to boost
the signal and would like to design an antenna w/o too much height or too
noticable for this gizmo (deed restrictions!)

> Can you define "changes" without reference to time?

My dog cannot tell time but knows when to eat by the
changes in her feelings from not hungry to hungry. Time
is just an artifact of man's mental model of reality.
Before man emerged, living organisms got by on changes
alone with no reference to time.

That reminds me of something I caught my Dad on one time.
Daylight savings time had just arrived and we set our
clocks forward one hour thus losing one hour of sleep. I
said, "Pity the poor birds who have to wake up an hour
earlier and fly around in the dark." My Dad said, "Yeah,
poor birds, - - - hey, wait a minute!"

Hmm, maybe Radio Shack's FM beam antenna -- about $20 I believe. If
it's small enough to fit your attic, that would get by the deed
restrictions.

Maybe in a parallel universe. But nothing remotely resembling
heavenly bodies existed in our universe before the Big Bang.
Where did you get such an idea?

Yep, you can say the same thing about a concept of God or a
concept of a soul. But models of reality do not dictate reality.
It is supposed to be the other way around.

Dave:

Your question, while at first seeming simple to me, I now realize is much more complex.
I looked at the ebay URL, and one "feature" of the device in question is:
Q. Is there an Antenna?
A. Yes, The Antenna is about 30" long made of thin flexible black wire

I would have NO clue on how to match up any antenna and transmission line to that!!!

Roy or another of the REAL antenna authorities are your best hope now... sorry... I am learning...

Warmest regards,
John

Wow.. I went looking on Radio Shack's Web site and the outdoor antenna's are expensive...
Were you referring to the Outdoor Antenna for UHF?

I seen on the web somewhere that I could get an antenna for about $30 or $40 for something like someone earlier had said a ground plane w/ drooping radials.

Mike Coslo wrote:
> What came (or went) before the Big Bang?

An event horizon didn't exist "before" the Big Bang
so "before" has no meaning in that context. If a
clock had existed "before" the Big Bang and survived
the Big Bang, it wouldn't have started running until
"after" the Big Bang. The primeval mass/energy was
virtually infinite. There was indeed literally a beginning
of what we experience as time. When all movement and
change ceases far into the future, what we experience
as time will no longer exist.

Well, you might be Hindu alright, but the "Dead Sea Scrolls" (the oldest existing Bible--well, with the possible exception of works the Catholics are rumored to have tucked away) proves Christianity accepts reincarnation to exist/occur... (as I understand it, some group of "Christian High Priests" decided the concept of reincarnation was too complex for the common man--so they dropped it from our Bible--you Hindu's were apparently able to accept this concept with greater ease.<grin>)

The only problem I can see is, "Do Hindu's and Christians get along?" What if "God" reincarnates ya both in the same neighborhood???? <grin>

Warmest regards,
John

"There`s far too much of old wives reading things in books and ill written radio magazines, getting the wrong ideas, and then plagiarising them."

Fact and fiction are both repeated. That does not make written material unreliable. It may mean you need verification of data. Reputation of authors is based on their performance. It does not make them infallible, just usually right.

Even an anecdotal tale may not repeat in your situation.

Repeatibility is reasonably expected or demonstrated in some instances. It is not necessary to make all the mistakes for yourself or to find all the "bugs" yourself. Reading can help avoid failures. Education is worthwhile.

T.A. Edison gave us the light bulb, the phonograph, and the movie machine. Nikola Tesla gave us powerful electrical machinery, transmission systems, and the ability to exploit alternating electrical power by appreciation of electrical principles better than others in his time. Tesla`s approach was educated and inspired by what he read in books.

You can experiment like Edison (98% perspiration, 2% inspiration) or reason like Tesla. Both methods brought tremendous results.

Best regards, Richard Harrison, KB5WZI

Ohhhh! Cecil:

Just when I think it is safe to go back into the water!!!!

You said, "But models of reality do not dictate reality."
I say the following:
Then how come I first, ever, saw a "moon mission" was Jules Vernes'(sp?)
mind at work?
How come the first time I seen a LASER was in "Buck Rogers?"
etc, etc, etc, ...
I WANT to think reality is something we "find" and "learn" and exists
without man, but, why then am I bit frightened it may be created in the mind
of man (at least some of it)--and one should, "Becareful what they wish
for!"

Warmest regards,
John

Mike Coslo wrote:
> I can't help but notice that to make your points you keep referring
> to concepts of time... 8^)

It can't be helped because concepts of time are imbedded
into our language. I can't type a sentence without a verb
tense, past, present, future, ...

The concept of time didn't exist before a conceptual animal
came along yet all the non-conceptual animals got along just
fine with no concept of time. They responded to movement and
change. Time is our shorthand math model way of keeping track
of movement and change. Doesn't mean that time actually exists.

Same is true for our other models. Your positive 'X' axis
points approximately the opposite direction 12 hours later.
The 'Z' axis is up and sweeps the universe like a quasar as
the earth rotates on its axis.

Our sacred FIXED point at the x,y,z origin is moving relative
to the center of the earth, moving relative to the center of
the sun, moving relative to the center of our local
cluster, ... Quoting from "The Tenth Dimension": "There is
a Doppler shift that appears to indicate that our entire
galaxy is moving with a speed of about 640 kilometers per
second in a direction whose significance is obscure."
Given all that movement, I'm surprised I can find my way
back to my house.

Correct!

> The concept of time didn't exist before a conceptual animal
> came along yet all the non-conceptual animals got along just
> fine with no concept of time.

That is a more tentative "correct". I don't know that animals,
especially the higher ones, don't have a concept of time.

But let us assume that they don't.

Then we came along, and spent some time (oops) contemplating the
universe. Humans could see humans being born, growing, dying. The
weather became cold, and them warm again. The seasons were in general,
predictable. When agriculture came along, those who planted their seed
at the wrong season starved. Those who watched the sky noticed a
correlation between the position of the stars at night, and the position
of the sun during the day, and the weather. Humans, having a marked
talent for finding patterns, eventually found the repetitious
correlation. As we progressed, the concept of time became more and more
refined, but none of the earliest concepts were refuted.

If is is wrong, it is magnificently so.

In that case I'd seriously recommend using ferrite rather than the powdered iron core. Type 43 or one of the 70 series would be best. Around ten turns on a fair sized core would be in the ballpark, but you could get more detailed information from the web site of the ferrite manufacturer.

The manual recommends that you NOT use the same 12v power source
as the transceiver. How is that possible. You mean I have to buy another
switching power supply for my home rig and another battery for mobile?

What is your interpretation of this statement in the manual and how did
you connect it to a power source?

I clicked by accident and say this incrediable remark by John. John,
If you read the Dead Sea Scrolls, you will find that the confirm
excatly the Hebrew Bible, the Christian Old Testment. Nothing about
reincarnation. The Scrolls were packed away by a conservative Jewish
group called the Essenes. No proof exists, except in legendary lore,
that the reincarnation was removed from the Christian Bible. BTW.
Hindu and Christian belief are polar opposites and both cannot be true.
I challange you to read the Dead Sea Scrolls, the Bible, and the Hindu
holy writings. Compare them.

Randy

I don't think reincarnation is mentioned in the Dead Sea Scrolls but
was believed by some Jewish and early Christian sects, particularly
the Gnostics.

http://reluctant-messenger.com/reincarnation-gnostic.htm

"One of the overlooked facts of history is that the believers killed
and subsequently wiped out by the Roman Catholic Church were THE GNOSTICS
AND OTHER CHRISTIANS who believed in reincarnation. It isn't a coincidence
that the century that saw the abolition of the Gnostics and other
Christians
who believed in reincarnation is the same century that the Roman Emperor
Justinian (545 A.D) made it punishable by death to believe in
reincarnation.
However, if Christ prophecied through the apostle John that the true
Christians
would be killed and that a false church would replace them, then IT IS THE
BELIEFS OF THE ONES KILLED THAT REPRESENTS THE TRUE TEACHINGS OF CHRIST,
NOT
THE TEACHINGS OF THE ONES THAT SURVIVED!!"

HOw about a full wave loop made from some leftover 300 ohm tv antenna
lead in wire? Thats what the FM store where you bought your receiver
sells you for 2.00 and if ;you want to transmit on it just cut it to
frequency and get after it.

Hi, Dave -

According to FCC Part 15 regulations at

http://www.access.gpo.gov/nara/cfr/waisidx_04/47cfr15_04.html ...

you are not allowed to modify your equipment. Specifically...

"Sec. 15.203 Antenna requirement.

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section."

Also...

"Sec. 15.239 Operation in the band 88-108 MHz.

(a) Emissions from the intentional radiator shall be confined within a band 200 kHz wide centered on the operating frequency. The 200 kHz band shall lie wholly within the frequency range of 88-108 MHz.
(b) The field strength of any emissions within the permitted 200 kHz band shall not exceed 250 microvolts/meter at 3 meters."

So, if you add an amplifier, you will exceed the maximum field strength (by a bunch).

Sorry to bring bad news.

Good luck.

John

1903. Balun 4:1

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-02 14:04:50 UTC

Source record: 77966

Hi! I'm building a homebrew T antenna tuner and would like to make the 4:1 balun for it. As I live in Brazil (northeastern and the poorest part of the country) it is very difficult to find ferrite cores in my city, i would like to make it with ferrite rods from MW radios. I have three ferrite rods with diameter of 3/8 inchs and lenght of 4 inchs.

I know it is possible to use them to make the Balun, but I would like to make one that can hold the maximum of 100 to 150W (it's for my Yaesu FT757GX use).

Does anyone have any project? I have small experience in electronics, so I would like detailed instructions to not make any mistake.

73,

Yvson - PR7BOK

Hi Richard...
I do not use my Heil CSS mobile so my only application is as a base station speaker. I purchased a Radio Shack 12v/500ma "wall wart" type power cube. It works fine and cost about $17. I am using a Radio Shack 12v/500ma (273-1773) adapter with the "H" (3.4MM)"adapta-plug".

Randy:

It is true that the Dead Sea Scrolls contain our whole bible, almost
verbatum.
But, I hope you are NOT claiming our bible contains ALL of the Dead Sea
Scrolls--it does NOT... (the catholic bible even contains a few more of
these books than the "King James" version (however, still the catholic bible
contain NO mention of reincarnation), it is in these obscure books (in the
dead sea scrolls), I would have to go back and search it/them, which
contains the reference in question--I am sure there are greater authorities
than me to argue this point as I am NOT all that devoted of a Christian...
just open to the possibility of "God."
And, certainly I BELIEVE in the existance of one-OR-many greater than I (or
greater than humans in general for that matter)...

Warmest regards,
John

Richard, I can see you adopt the same attitude as I do towards questions on this newsgroup which begin with "I have heard that . . . . ".

Hardly a reliable start to a question. One gets the impression the questioner is unlikely to be able to understand the answer and tailors the answer to suit.

Looking back over my career, I have never(?) taken anything out of a book (Terman, etc) at face value. The number of occasions on which errors and uncertainties of one sort or another have come to light has justified the time and effort expended in checking.

Anybody who quotes Terman as from a Bible has only ever read him but must have never actually used him in anger. I mention Terman only as an example but hasten to add, in my opinion, he is amongst the most reliable of popular technical authors. I have only his first edition produced in the middle of WW2.

The work which continued during the life and death struggles between the nations of WW2 never ceases to amazes me. During the battles of Leningrad and Stalingrad, Russian engineers were designing High Voltage DC power lines from yet-to-be-built hydro-electric power stations deep in Asia, into Europe.

Stalin himself was concerned with the nutrition and the future of school children. During the horrible prolonged battle of Stalingrad he directed that children and mothers, then living in the frozen sewers beneath the ruins, should be given top priority with food rationing. This was based on the grounds that the average life of a soldier in the city, having just survived crossing the river Volga, was only 7 hours and consequently he would not have time to eat and fully digest a good meal.

As is well known the Germans ran out of food and ammunition first and the survivors crawled out of the sewers and burning buildings to surrender. The German generals must have known then the war was lost. But it was not until 6 months later, in the Battle of Machines around the city of Kursk, on the broad summer grasslands of the surrounding steppes, littered with thousands of burning tanks, wrecked mobile guns and aircraft, and deserted troop carriers, that Hitler must have been convinced of ultimate defeat.

But another two years were to elapse and millions of Russian, Polish and German lives were still to be lost before Russian tanks crossed the Oder and Russian rockets and shells began to rain down on Berlin.

Reg, G4FGQ.

Reg:

I can see how one such as I might be confusing.
I came from academic institutions which (stated) they believed, "There are no "dumb" questions, only "dumb" people who WILL NOT put these questions forward."

I interpreted this to say, "You can either choose to look STUPID with your question--and change, or, you can choose to maintain your pride (remain silent) and remain "STUPID!"
I would like to think I choose the first (but, due to my limited resources, has only marginally improved my stupidity)...

Also, it was common belief that a person had to hear the concept, idea, etc. six-times before it was absorbed by the mind in question and became "knowledge."
There may be those gifted in absorbing information on the first try, however, I fall into the group I mentioned above. <frown>
It does make me appreciate men/women/children with tollerance and patience--if that is any factor which would redeem me....

Warmest regards,
John

|
| Richard, I can see you adopt the same attitude as I do towards
| questions on this newsgroup which begin with "I have heard that . . .
| . ".
|
| Hardly a reliable start to a question. One gets the impression the
| questioner is unlikely to be able to understand the answer and tailors
| the answer to suit.
|
| Looking back over my career, I have never(?) taken anything out of a
| book (Terman, etc) at face value. The number of occasions on which
| errors and uncertainties of one sort or another have come to light has
| justified the time and effort expended in checking.
|
| Anybody who quotes Terman as from a Bible has only ever read him but
| must have never actually used him in anger. I mention Terman only as
| an example but hasten to add, in my opinion, he is amongst the most
| reliable of popular technical authors. I have only his first edition
| produced in the middle of WW2.
|

| The work which continued during the life and death struggles between
| the nations of WW2 never ceases to amazes me. During the battles of
| Leningrad and Stalingrad, Russian engineers were designing High
| Voltage DC power lines from yet-to-be-built hydro-electric power
| stations deep in Asia, into Europe.
|
| Stalin himself was concerned with the nutrition and the future of
| school children. During the horrible prolonged battle of Stalingrad he
| directed that children and mothers, then living in the frozen sewers
| beneath the ruins, should be given top priority with food rationing.
| This was based on the grounds that the average life of a soldier in
| the city, having just survived crossing the river Volga, was only 7
| hours and consequently he would not have time to eat and fully digest
| a good meal.
|
| As is well known the Germans ran out of food and ammunition first and
| the survivors crawled out of the sewers and burning buildings to
| surrender. The German generals must have known then the war was lost.
| But it was not until 6 months later, in the Battle of Machines around
| the city of Kursk, on the broad summer grasslands of the surrounding
| steppes, littered with thousands of burning tanks, wrecked mobile guns
| and aircraft, and deserted troop carriers, that Hitler must have been
| convinced of ultimate defeat.
|
| But another two years were to elapse and millions of Russian, Polish
| and German lives were still to be lost before Russian tanks crossed
| the Oder and Russian rockets and shells began to rain down on Berlin.
| ----
| Reg, G4FGQ.

Hi Reggie,

Reliability in questions? You've got the cart before the horse. If
"I have heard that" was an introduction to a statement, or development
of an idea; yes, certainly, a poor beginning. But as an introduction
to a question, it is apparent that the questioner is begging
contradiction or confirmation for "I have heard that."

In my particular instance, I supported the generality by offering a
new perspective and confirmation. Mike appreciated it, and that was
enough apparently as the remainder of discussion wandered the field
kicking over other stones.

>One gets the impression the
>questioner is unlikely to be able to understand the answer and tailors
>the answer to suit.

Hardly uncommon, and successive correspondence removes any doubt or
resolves the enquiry. This is the point of posting afterall. The
only one posting threads I've seen are my own. ;-)

>Looking back over my career, I have never(?) taken anything out of a
>book (Terman, etc) at face value. The number of occasions on which

>produced in the middle of WW2.

The utility of references is manifold. Some use them as rubber
crutches for their xeroxed theories. I've noted this on more than one
occasion when Optics is so thoroughly pimped to serve impoverished
notions.

However, even in this, and other instances, such citations offer the general readership a bibliography and some insight into the depth of discussion to be found in those references. When all I see are endless lines of copied equations, I am not impressed. However, when I see logical development proceeding out of the topic at hand, the original author would bear closer examination.

I have several of the cited works mentioned here. Too many are as dry as bone, and hardly useful beyond the examples they laboriously wade through the math to cover. Others are indeed treasures of first principles.

What this reduces to, is to lean heavily upon the cliche of "Old Wives' Tales" to whitewash a thread is in itself reducing the discussion to voyeurism and is neither an original nor useful insight. Kelvin would hardly be impressed at such rhetoric that evades specifically challenging loose references. The difference is Atlantic, we are less impressed by the arch comments that typically inhabit "a letter to the editors of the Times." If you care to polish up your style, I would suggest researching the better pieces written before the age of TV (or radio for that matter).

Hello All,

For those who have visited my website on the slow QSLnet -
server, my page is moved to: http://pd0rkc.mine.nu

On my site I have hamradio info:

Antenna
International Space Station (active on 145.800Mhz FM).
Software
Kenwood (connector and reset info).
Coax (chart with many cables so you can compare loss).
DX information (realtime tropo and aurora maps).

Well if you know some information wich is not on my
website let me know!
I am looking for proffesional antenna calculation software!

Since you provide links to info on coax and a couple of antennas, don't let them fault you for "off topic." <grin>
I downloaded and listened to your QSO, intersting, however, they just brushed off "micro-metorites", if one not only punctured the spacestation--but their body, I suspect they would not dismiss its' importance so quickly!!!
"Kewl" that you provided it in .mp3 format, thanks!

One thing though, sneaky way to grab your "fifteen-minutes of fame", my friend... <grin>

Warmest regards,
John

Richard,
Since the 70 cm antenna will be a low impedance at 2m, how about connecting the 70 cm antenna to the 2 (and feedline) with a piece of coax that is an add multiple of 1/4 wave at 2m? At 70 cm they might both be active. I might try EZNECing it for a pair of dipoles. Or how about 2 pieces of coax, with a T connector to the feedline? Personally, I would buy the filters.
Tam/WB2TT.

1930. Re: balun recommendations

Newsgroup: rec.radio.amateur.antenna

Approximately 12 turns of 18 gauge speaker wire on a 2" diameter
ferrite ring will do the job.

Ferrite material with Mu = 200 to 500, ordinary LF to HF grade will be
OK.

If Mu = 10 then the core material is iron dust. Permeability is much
too low. Many turns would be needed to obtain sufficient inductance
at 80m. Too many turns prevent correct operation at 20 and 10m. And
the wire would be too thin for operation at 200 watts.

Reg, G4FGQ.

Apparently, we live in a world of 4 dimensions.

x, y, z, j*t

Have I ever seen (not heard) t preceded, as above, by the square root
of minus 1?

If so, what special properties does j confer on t when applied to it?

Why should time be rotated through 90 degrees?

John,

Thanks for that info didn't realize the complications / legalities...
Think it'll be ok if we just turn on the amp when she's at the pool and turn
it off when we're not?

I appreciate all the information given to me so far.

Dave

|
| Hi, Dave -
|
| According to FCC Part 15 regulations at
|
| http://www.access.gpo.gov/nara/cfr/waisidx_04/47cfr15_04.html ...
|
| you are not allowed to modify your equipment. Specifically...
|
| "Sec. 15.203 Antenna requirement.
|
| An intentional radiator shall be designed to ensure that no antenna
| other than that furnished by the responsible party shall be used with
| the device. The use of a permanently attached antenna or of an antenna
| that uses a unique coupling to the intentional radiator shall be
| considered sufficient to comply with the provisions of this section."
|
| Also...
|
| "Sec. 15.239 Operation in the band 88-108 MHz.
|
| (a) Emissions from the intentional radiator shall be confined within
| a band 200 kHz wide centered on the operating frequency. The 200 kHz
| band shall lie wholly within the frequency range of 88-108 MHz.

Hmmm, what does "x" represent?
y, z, j?
I expect t = time?

Does this equation carry the mathematicians name?

How do I find reference of it?

My degree is NOT in math yanno!!! I only use math as a means to an end!

Warmest regards,
John

Well now that you mention it, go and read the Sermon on the Mount,
where Jesus issues some of the most definitive commands he ever made.
Next compare it to how the "born agains" speak and act.

I believe that your last sentence might be accurate.

Errr, and that is assuming (yes, I know, I keep making that mistake) that the two turn winding (bifilar winding) is used in a "phase reversal" configuration" for unbalanced-to-unbalanced 1:1 effect". and, I think this qualifies as a "current balun."

Why the trifilar winding becomes a "voltage balun" is a concept still escaping me...

I am working on that, for anyone who would like to explain?

Warmest regards,

John

Well, I certainly don't see any sense in being a "pain", or, if it is not necessary--to perform irritating actions to "irk" anyone--I don't really get any enjoyment from that (I will provoke someone to anger to learn (or worse) <evil grin>, if I am devoid of alternatives...)

I will limit my spontaneous actions of responding because it titillates me... <grin>

However, does JP Morgan maintain this thread? If so, why doesn't he set options to "bounce" that stuff?

Warmest regards,

John

Well gee, Reg, I did hear it and it was in here. Okay, I saw it on my screen to be more precise.

And as for the depth of my understanding? It is *not* very deep. I am a beginner in RF, having spent most of my career in computers. But I attempt to learn. I hope to understand. And I appreciate the answers that people have taken the time to give me.

And for the most part, I *do* pick up what I am told.

Well, you are correct, we live in a universe where everything hasn't ALL occured at once... and we have a "progression of events"... time is not a "cause factor" of them, you want to argue it is an "effect of them", and indeed--it even looks like that to me... (especially when I tap my red heels together, close my eyes and repeat, "I want to go home! I want to go home! Would take time ta git home, yanno! And, Toto wants to go to! <grin>)
And, a law of physics is "every action has an equal and opposite reaction", so, I think it follows, we are still viewing the "reaction(s)" to the big bang... with all events we are now viewing caused by its "action"; and, we even live under the delusion these "reactions" are logical (obey "just" laws of physics!!!!)

What worries me more, is when the universe becomes "static" (no free energy yanno, one of those darn laws of physics, something is "spinning" all this "stuff"--why would the universe be "perpetual motion? Well, unless 'God' spins it!") what then?

Will you admit time would cease to exist then? And, why? Just because all motion stopped? <grin>

But, "time" is not real.... (Alzheimers yanno--I forgot I already mentioned that--sorry! <grin>)

Warmest regards,
John

JP is equally guilty as we are of maintaining the thread. Interesting seeing that his opinion of the spamming for god folks is fundamentally (heheh) Much the same as ours. WE choose to make fun though, while he takes the serious approach. That is fine I guess, but it is easier to kill the thread. I've got several threads blocked even as we speak.

Oy, and happy as a little monkey I is!.....

BUt out of respect, I have trimmed the groups.

I like your "Spamming for God!" terminology... <grin>
However, I don't know if the BIG MAN up there (if he is up there--or she!)
would approve... <frown>
This is my last response here... JP is right, enough is enough--I guess...
BUT.... it is so damn tempting!!!! <evil grin>
I hope JP can understand if we can't control ourselves...
<guilty-child-look>

Warmest regards,
John

No. Any being that considered itself a "god" after the universe was
created is constrained by the physical laws it was presented. So it
can't really do much to affect anything outside its local environment.
Which is probably a good thing.

Not even that. It would still be a day and a year.
Nothing would change if time doesn't exist.

Reg, G4FGQ wrote:
"The German Generals must have known then that the war was lost. But it was not until 5 months later, in the Battle of Machines around the City of Kursk, on the broad summer grasslands of the surrounding stepps, littered with thousands of burning tanks, wrecked mobile guns and aircraft, and troop carriers, that Hitler must have been convinced of ultimate defeat."

You would think so. Fortunately, for the most part, Hitler wasn`t known for seeking and following the counsel of his subordinates, some of whom were very competent. Often it seems Hitler believed what he wanted to believe. His hubris was a serious fault, second only to his lack of respect for human decency. The world would have been better off had Hitler had minor vices, I believe. Hitler was a teatotaler, non-smoker, vegetarian, and monogamous. Why couldnt he have been more like a Churchill or a Roosevelt? With less imagined supeiority, he might have been an ordinary fellow.

Hitler may have refused far too long to admit that Germany had lost the war, but there are plenty of stories that his subordinates knew.

They were aware of the Allies weaknesses but they also recognized Allied strength.

U.S. P-38 fighter planes were outclassed by single-engined German fighters over Europe. But, when Herman Goering saw P-51 fighters escorting Allied Bombers over Berlin, he is reported to have declared Germany as the loser in the war, and that Germany should immediately seek peace. He said that, knowing the Luftwaffe, though on the defensive, was equipped with fantastic weapons including superb conventional aircraft and with jets and rockets coming online. The fact was that the U.S. could build aircraft faster than the Germans could shoot them down.

Best regards, Richard Harrison, KB5WZI

Ah, but they echo range. (Time.) Only way you ever nail one is with a tennis racket. They "hear" the racket itself and miss the strings. This has GOT to be one of the dumbest threads John Smith has ever started.

And they were doing so long before the concepts of time,
perception, echo, and range were invented. Those things
are part of the malleable human model of reality and
probably do not even exist in the bat's hard-wired
model of reality.

Dear Cecil,

Depends upon what you really mean by "perception". I don't think
"perception" has to mean that they consciously think about it, any
more than a human has to consciously think about it. In both cases,
animals and humans are able to make inferences from listening to
echoes. They can and do infer that the reflections are further away
when the elapsed time for the echo is greater. The big difference is
that bats don't make such a big deal about RADAR.

I mean there is no need to perceive time. Change is all
that needs to be perceived. We perceive what we label as
time by correlating changes to each other. The perceived
lapsed time between the sending of a sound and the receiving
of an echo is simply the correlation of external and internal
changes by some sophisticated biology. One of the earliest
Greek philosophers, Parmenides, maintained that there was
neither time nor motion, only change.

I paid $350 incl shipping for my used IC-735 last year, and that included
the PS-55 power supply and cable. It's a 5 minute (clip one diode) job to
open the transmit capabilities, and all that time is spent taking apart and
reassembling. So that mod adds no $ value to the transceiver, in my opinion.

I bought my 735 new in the early 80s for $8xx, so he's asking close to new price. They currently sell for about $300 to $550, depending on condition and accessories. Some of the early 735s have plastic trim caps that cause instability; they need to be replaced with ceramic caps when the originals go out. Also, the encoder for the main tuning knob is no longer available from Icom, so when the encoder goes out, you may or may not be able to find someone who can repair it (I was lucky, got mine fixed.)

Having said all that, the 735 has an excellent receiver and is a really good CW rig, in addition to the other modes.

Also, the 735 from the factory has out-of-band coverage for the MARS frequencies, so the fact that it has been "opened up" doesn't mean a lot, unless you want to do 60 meters or the CB thing.

If you can get the guy to come down about $2-300, that would be a fair price.

Oy! Now there is a way to solve problems!

I have not read the book, so cannot comment with authority, but it seems Julian is in a hurry to throw away time in order to solve problems that can or will be solved without tossing time.

The amount of disciplines that "time" cuts across are many. The concept has served us well for a long long time.

The "answering" of quantum effects issues by throwing out time will probably create many new problems with just about everything else.

My curiosity is piqued. I'll have to read the book.

1978. Comet C767NMO

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-03 15:48:48 UTC
From: Dave <jdarmbruster@gmail.com>
Message-ID: <1115135328.451552.298300@z14g2000cwz.googlegroups.com>
Source record: 77841

I have a C767NMO antenna that I'm trying to make sure works.

Using an ohmmeter, I measure an open from the center pin of the base to the bottom section of the whip. I measure an open from the center pin to the base threads (i.e., the antenna does not present an apparent short at the feedpoint). However, I also measure continuity from the threads on the base to the bottom section of the whip.

I called NCG and they say the antenna is fine since it's capacitively loaded. That makes sense as to why I would not see continuity from the center pin to the whip. But, that does that also mean that there is an inductor from the whip to ground? That is the only thing I can think, that there is an LC circuit in the base, with a capacitor from the center pin to the whip and a inductor from the whip to ground.

Do these DC measurements jive with other users of the C767? Just want to make sure before powering my transmitter through it.

Regards,
Dave

Building something a bit like this :
http://www.hamuniverse.com/multidipole.html

He suggests setting up one wire at a time starting with the longest, is that the easy way ?

I would think adding all wires, a bit too long , and then starting the adjustment with the shortest would be better ?
All the other wires overlap the shortest 100%, so I would imagine later trimming of longer wires i parallell would not affect the short wire much.

"At 70 cm they might both be active."

The impedance of the 2-meter antenna is unknown at 70-cm. With 1/4-wave or less of cable at 70-cm, velocity factor considered, you should be able to make the 2-meter antenna appear a very high impedance at the common point where the 2-meter and 70-cm antennas are oaralleled.

Best regards, Richard Harrison, KB5WZI

I have made a couple of the NJQRP W1CG low power 4:1 current baluns.
See:
http://www.njqrp.org/balun/index.html

The author says they can be used for longwire. Inasmuch as the
balanced terminals seem to have identical circuitry behind them, it
would not appear to matter to which balanced terminal you connect the
longwire. Where do you connect the other balanced terminal? To RF
ground? To a tuned counterpoise? To the sheath of the coax on the
unbalanced side?

Consider that our entire universe may have been just one
of a large number of black holes and the only difference
is that ours reached critical mass and exploded. All of
existence may contain many bubble universes, some even
colliding with each other. I once read that there is a
section of our universe out near the edge where the objects
are blue shifted indicating something very large coming
at us and it is only about ten billion light years away.

You are placing far too much importance on your objective of having
each dipole resonant. It matters oh so very little from any point of
view.

Change is binary. Either something changes or it doesn't.

Here's a question for you. Does time itself flow or are we
flowing through time? If we could travel at the speed of
light, would we be synchronized with the flow of time?

So you say, but there is no such claim at the referenced Web site or in the Construction Manual. Also, does it make any sense to refer to it as a balun if it does not have a balanced circuit on the balanced side?

>Inasmuch as the
>balanced terminals seem to have identical circuitry behind them, it

Exactly my point. Where?

>To RF
>ground? To a tuned counterpoise? To the sheath of the coax on the
>unbalanced side?

If it hurts, don't do it.

Bottom line - a long wire is fed against ground. There is no point to a balun, unless you intend to use a balanced feedline from the transmitter to the long wire feedpoint - in which case the balun is applied in reverse - and of course you will need another balun at the transmitter to make the transition from the unbalanced transmitter output to the balanced line.

What would the purpose of building a multidipole be if not to get a
resonance on each band ?

My goal is to run psk31 on several bands without a tuner.

I have two IC-735S, bought both on eBay, paid under $375.00 for each of them. One of them included the Icom power supply. Both in excellent shape, work perfectly.

Shop around eBay.

You are correct. I mixed up something I read about my LDG 4:1 voltage balun:
http://www.ldgelectronics.com/rbalun.pdf

Is LDG correct? If so, then for a voltage balun and longwire, I should use an RF ground on the second terminal. What if I don't have one? Should I short it to the coax sheath? Or would a counterpoise be better?

If I have a tuned counterpoise, should I use the current balun, or the voltage balun?

If the voltage balun helps with a longwire, Can you suggest how to change the wiring on the W1CG balun so that it is a voltage balun?

Also lost in the sands of time is the advice that a longwire needs a 9:1 or 10:1 balun. Is that true? If so, is that a current or voltage balun?

One would think that for a $200 devise, we could ask the manufacturer to make this thing RFI proof....
I believe what they're saying is that if you have a bunch of cables (audio, power, etc.) that are full of RF, they sufficiently block it internally such that it doesn't affect the sound coming out of the speaker. However, there's really not much they can do to get rid of any RF on the cable insofar as it being picked up by _other_ equipment around your house, and it's here that one typically ends up with a bunch of ferrite cores around the cables as an attempt to reduce the RF on them.

I realize that $200 is a fair chunk of change for a lot of people, but I think it's quite reasonable considering what you're getting and the quantities they're likely producing them in.

This is a SWR bridge I built using leds and a homemade "directional coupler."

ALL critiques on it, and ideas for improvements are welcomed!!!

Please excuse my rough drawing, I am NOT a draftsperson!

Hopefully, the attachment of the .jpg was successful....

Warmest regards,
John

2003. Greek Double Rhombus

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-03 19:46:28 UTC
From: "J. Mc Laughlin" <jcm@power-net.net>
Message-ID: <117fl7p6psa0r58@corp.supernews.com>
Source record: 77866

With a few minutes of unscheduled time and a need for a bit of intellectual stimulation that could not be provided by the sophomoric responses to the troll's messages on the news group, I decided to investigate the antenna put forth by one or more of our Greek attendees. Unfortunately, the original drawing of the antenna seems to have been withdrawn.

I assumed: a "small" angle of 60 degrees, #12 AWG Cu wire, and each of the seven wires to be 21 meters long cut into 21 segments.

The resulting antenna has a FS fundamental resonance at about 7.45 MHz with a 1.5:1 SWR bandwidth relative to 900 ohms of about 500 kHz. The next higher resonance occurs at about 11.27 MHz with a 1.5:1 SWR bandwidth of about 150 kHz relative to 200 ohms.

The antenna was elevated 40 meters above perfect ground and evaluated at 7.45 MHz. For most elevation angles, the pattern has four lobes. The two front lobes have a minor dip between them over elevation angles from something like 10 degrees to something like 25 degrees. Below an elevation angle of something like 10 degrees, the mid-lobe null is pronounced. Side nulls are excellent. Front-to-back ratio is poor.

If one wished to cover a fairly large sector at 1 Mm or so and needed a straight-on null of a distant station, this might be a useful antenna.

I did not consider the effects of rotating the antenna 90 degrees so that the antenna is in the X-Y plane.

Here are the FS coordinates that I used for the ends of the wires:
(X,Y,Z)
0, -10.5,0
0, 10.5,0
0, -7.687, 10.5
0, -28.687, 10.5
0, -28.687, -10.5
0, -7.687, -10.5

The wire from 0,-10.5,0 to 0, 10.5,0 was driven at its mid-point.

Source record: 77867

Just to confuse you more, balun is word constituted out of BALanced to UNbalanced transformer. Assuming what you want to do is feed a long wire with coax and do a "impedance match" to your long wire. What is needed is an UNUN or UNbalanced to UNbalanced transformer as a long wire is feed against ground and is an unbalanced load. The terms current or voltage do not apply to UNUN's.

2007. Re: multidipole adjustment

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-03 20:21:31 UTC
From: John Passaneau <jxp16@psu.edu>
Message-ID: <d58mg8rhu1@f04n12.cac.psu.edu>
Source record: 77868

Hi:
There is a large amount of interaction between the dipoles as they are tightly coupled to each other.
The shorter or higher frequency are affected more by changes to the lower frequency i.e. longer dipoles than the lower frequency dipoles are by changes to the higher frequency or shorter dipoles.
So to keep hair pulling to a minimum start with the lowest frequency dipole, tune that for the lowest SWR or for resonance and then do the next lower one. If you do it in any other order you will spend your life going back and forth retuning dipoles until you give up and buy a G5RV kit and join the dark side.

Strange..
I can understand that hanging a long wire next to a short will affect more
than the other way round.

But if they are both up there, I would have thought trimming the long wire
would not change its affect on the short wire much.

Ok, thats the order of trimming, but do you install one wire at a time or
all of them at once ?

It's basically the whole point. No tuner needed, and a dipole
pattern for each band there is a dipole for.
Looking at that pix, they are using the "hard" to tune design.
The elements are close stacked, and this makes coupling a problem.
It would be much better to spread the dipoles out in different
directions, IE: N/S, E/W, etc, to keep them spread apart.
Always start with the lowest band and work up. If each dipole is
not resonant, how will you keep your radio from shutting down?
Use a tuner? That defeats the whole purpose, and the low loss of
of resonant dipoles, fed with coax. MK

Yea, as other note, 7 bills is a bit high...It would have to be super
pristine, and very low miles to consider paying that much. I mean
totally mint. Not a scratch on it....It is a good radio, but the
average
going rate these days is 300-500 ?? bucks...And 500 would be on
the higher end...For $700, I could get a fresher 746, etc....I've seen
used 706mk2g's going for less than that...Also, be aware that some
parts may now be unavailable for the 735. I have a nice IC-730
collecting dust cuz I can't find the part I need to fix it...The 735 is
a
later version of the 730...Icom considers those radios ancient history
when it comes to parts...Heck, they don't even sell the finals for
706's
any more, as the final transister is no longer made..You have to buy
the
whole PA board for 400+ bucks....With the old style transisters...:(
Needless to say, I baby the finals in my 706mk2g....MK

It always bugs me that a length for 80 meters is given to a decimal point.
Also 119.2 feet seems way too short to put you in the packet area of 80
meters. I would think it would be closer to 130 feet or so. Maybe more.
Then you could cut it to length. I am not going to look up the lengths but
you may want to check the other dipoles to see if they are long enough for
the low end of the bands.

Well, we certainly have learned something here, and that was the point this all began....

"If everyone can't even agree on time--we are going to even have a bit more problem with other "myths."

Truth is, if you choose to believe in "time", you do no harm, if you choose to believe in a christian "God", you do no harm, if you choose to believe in "radio theory", you do no harm...

Personally, Santa gets my vote!!! HEY! Wait a minutes, that's me, or at least that is what my grown kids think!!! <grin>

So, we proceed.... hopefully with patience and understanding for such as the like of me--a newbie...

Regards,
John

"John Smith" <assemblywizard@gmail.com> wrote in message news:hBwce.68$3M3.4274209@news.sisna.com...
| Let me give you my "Mental Model."
|
| There is no such thing as "cold."
| There is no such thing as "heat." (there is infrared radiation--i.e. a
| frequency(s) of vibration of atoms)
| Cold is the absence of heat, absolute cold (absolute zero) is a single
| measurement of one state of heat (vibration/movement of atomic
| particles)--NONE!
| Heat (hot) is really a measurement of the state of exicted atomic/sub-atomic
| particles movement, and of that movement producing "heat" through the
| friction produced by the movement of these atomic particles...
|
| Next, there is no such thing as "time!" Time is simply a measurement of
| movement! Indeed, our time is based on the rotation of the sun and
| planets... (atomic time on the decay of a radioactive substance--but again,
| physical change and movement!)
|
| I realize that specific "mental models" have been created, taught, adopted
| and followed (too religiously if you ask me!) for discussing and describing
| "radio." However, most of these are far from "real things!"
|
| Warmest regards,

| John

I've a horrible feeling this (not your SWR bridge) is not going to work.

Where is your .jpg ? I can't find it.

Does Cecil's comment mean that it is impossible to attach it to a newsgroup message. Or does it mean only that the powers that be won't like it.

There's another problem. If you attach anything to an e-mail there's a fault in my computer and I shall be unable to open it. When it comes to operating a computer I am just a novice.

By the way, have you actually got your bridge to work in some fashion or other?

If it's still only on paper the likelihood of me being able to make any sensible comments is pretty poor. But I'll try.

There is a program on my website named SWRMETER which you may care to amuse yourself with.

Reg.

He is just another cber too lazy to get a ham license so the best he can
do is attempt to slam ham operators. Ham radio out performs cb radio in
so many ways it makes cb look really pathetic, and the cbers have done
an excellent job themselves of making cb look pathetic by making 11
meters the sewer pit of the radio spectrum.

Yes put up all the wires at the same time. There will be an effect on the lower frequency antennas by the higher frequency ones and putting up all the wire will get you closer on the first try than putting them up one at time and tuning them will. I've used this type of antenna for years and they work quite well. The interaction between the dipoles can be minimized by putting the dipoles at right angles to each other. That is say, run the 80m dipole north/south and the 40m dipole east/west. That minimizes the coupling and the dipoles act almost like single band antennas. In my system I have a 160/80/40/30 meter dipole antenna. It has the 80/40 wires running parallel, spaced about 12" apart and at right angles to that is a loaded (shortened) dipole for 160m and the loading coils in the 160m antenna act like traps and make a 30m dipole. It's all feed with one coax.

The 80m dipole acts just about the same as if it was the only dipole up there, but the 40m dipole is strongly affected by the 80m wire. The most noticeable effect is the SWR bandwidth is a bit smaller than I would expect from a single 40m dipole and the tuning is a bit more sensitive.By that I mean it takes a smaller change in length of the 40m wire to move the resonate point some KHz's than it would with a single band dipole. All that means is you have to be careful with how much you cut off and take it in baby steps, not big chunks. I first up the 80/40 antennas and a year later I decided to get on 160 so I added the 160 wires. When I added the 160/30m wires at right angles to the 80/40m ones there was almost no noticeable effect on the 80/40m dipoles. You can download the EZNEC demo antenna modeling program and see how the antennas interact your self. One thing you will notice is that when your operating on 40m the 80m is also working a little bit too. Anyway I have DXCC on 80 and 40 and working on it on 160 and 30m which are the last bands I need DXCC on.

Good luck

ok.... whether it's a BALUN or an UNUN, I'm using the same type
of "matching device" or "impedance transformation device" with an
end-fed wire that's roughly 1/4 wavelength at 160 meters (so I
guess that's about a 40 meter piece of wire). One "balanced"
terminal goes to the wire, the other goes to a ground rod. I'm
sure it would be just as happy, maybe happier, connected to a
counterpoise instead of the ground rod.

Works quite well.

Yes, I am sure you are quite correct about it being as happy with the counterpoise as a ground rod, however, it STILL would be an "unbalanced" ant... and requireing an UnUn, IF my understanding is correct... a dipole is "balanced".....

Regards,
John

Thats exactly what I am trying make on top of a flat-roof building.
The building is 56x12 m so I cant quite get anything at a right angle but I
will try to get as much angle as possible. Also it is not long enough for
the 160m but the idea is to go diagonal and then across at the ends like a
'Z'.

Lou I can see your point but how can Bob foresee every installation? What about the guy that places his Heil CSS on top of his AL-1500 and then complains about feedback from this "no good over-priced speaker?"

Every Ham should already have a clean and neat cable system and effective RF and electrical ground. And while I'm on my soap box...Radio Shack has 2 different ac power adapters that can power the CSS..and they range from $15 - $17. If you can afford $210 for a speaker but can't go the $15-$17 for the power source let me know..I'll send ya one! Sheesh...

Charlie,

This unit costs $210!....and now you have to power it externally........

And add torroids ...."Each Heil Clear Speech is tested in 1.5KW system and is guaranteed to be free of any RFI as it leaves the Heil assembly plant. ANY RFI problem encountered must be rectified by proper installation, use of correct toroid cores or ferrite beads." Doesn't make sense....is it RFI proof...marginaly RFI proof...or not?......

One would think that for a $200 devise, we could ask the manufacturer to make this thing RFI proof....

People continue to confuse "symmetrical" with "balanced". A dipole is symmetrical. Twinlead feedline is symmetrical. Both can be balanced or unbalanced. Coax can be balanced or unbalanced. I've done my best to explain it, but I've obviously come up short.

Roy Lewallen, W7EL

And, you know partner, that is one VERY CHEAP SHOT... I am betting it is indicative of your whole character....

You should have mentioned it is from rec.radio.cb...

The group there are truck drivers, when speaking to truck drivers a much different form of speech is chosen than in other groups...

It would have been much more appropriate to have mentioned that.... or, even better, to have referred them to rec.radio.cb and told them I was posting there... either or both would have been preferable...

That is uncouth... what next... pickup something from a porn room and drop it here?

Indeed, if you look in the above postings, of mine, in this group, you will find I have expressed these same ideas here--with gentler nouns, verbs and text... but then, I think you are for another purpose... perhaps because you are feeling you are losing the argument there, and so wish to sick more hounds upon me?

You have a number of problems. Where did you get that design?
In order to separate the forward power from the reflected
power, you need to use phasor addition/subtraction of voltage
and current. You only have current sampled. Where is your
voltage sample? Where is your phasor addition/subtraction?

There will be an effect on the
lower frequency antennas by the higher frequency ones and putting up
all the
wire will get you closer on the first try than putting them up one at
time
and tuning them will. ....

Myself, I think starting with the low band, and building up, is the
best practical method. You can still do them all at once, but I'd
tune each in the ballpark first, starting low,before I moved to the
next
higher band. Note your later statement...
" The 80m dipole acts just about the same as if it was the only dipole
up
there, but the 40m dipole is strongly affected by the 80m wire."

It's almost always the higher band that will have problems, as this
example shows. It will be very rare for say a 40 to mess up a 80 ant...
But quite common the other way around.. So being thats the case,
I always start low, and work up through the bands...You can always
fine tune after it's all done...I usually do in fact....
Like you say, if the dipoles are at right angles, there is almost no
interaction...In fact, I've had a leg fall down before, and not effect
the match of the other bands. I always spread them apart with the
widest spacing I can...IE: right angles if two bands...
Stacking them like that example on the web page is the worst way
to go about it as far as coupling problems. But....Once you get one
tuned, they will work...I just prefer spread apart...

Also it is not long enough for
the 160m but the idea is to go diagonal and then across at the ends
like a
'Z'. ....

That's what I'm using here. I'm on a city lot, so 80m is the largest
dipole I can put up in a straight line. I have a 160m "Z" dipole. It's
a
better compromise compared a loaded dipole to fit 120 ft. I have
the 160, 80 and 40 on one feedline. I have extra insulators to
turn the 160 into 20m if I want....I do that sometimes in the summer...

Well, can't remember where I seen that "directional coupler", but will be willing to give the designer credit if he makes himself know...

The led indicating circuit is my design...

It seems to work, all I have is another SWR with analog meter I constructed myself to compare it with, soon as I locate someone with a commercial meter--I will compare both of mine to it... Only real apparent problem is the REF led changes brightness slowly (and here it is hard to "judge" SWR by brilliance), until right at, or near, match, when it will plunge to darkness rather quickly...

Well, show me what is wrong and suggest an alternative circuit or mods to set it proper (or explain in text, I will see how good I am at word problems here)--I am all EARS Cecil... <smile>

I still have one CB radio that I keep operational. I turn it on to reaffirm why I became a ham. In the early '70s, CB was still an honorable communication means employed by many groups performing public services. Most operators were considerate; the key word here is "were".

If we had a national emergency today, John and his "good buddies" would step on each other and crank up their "leenyars" to the point they would wipe out the nationwide 11 meter band with heterodyne. Wait---they already do that on a daily basis.

Quite a number of truckers are now licensed hams--they need to be able to communicate more than a mile or two.

I have good memories of my CB days, and I appreciate that it got me into ham radio. Unfortunately, "Sewer Pit" is a realistic description for what it has become in many areas--including mine.

Illegitimi non caborundum.

Hi Brett,

A most unusual indicator if ever I've seen one (and I've seen many).

What you have (if you can generate enough voltage - it will take about
35-40W of transmit power) is an emergency flasher weakly lighting the
alternate LEDs at an HF rate.

This is with Red LEDs, as I offered in another posting, if you tried
with Blue LEDs, you would need more like 170W to weakly light them.

The 100K is literally useless (as are the 1N914s), and the 1K is a
severe handicap. Once you get past those limitations you will have a
brighter flasher at no big hit to the overall efficiency - if a
flasher is what you want. Mad Man Muntz with his dikes would have a
glorious time trimming back the excess here.

It might sell well to the CB crowd that wants 27 MHz strobing brake
lights. Could even perform better for night time DX than some rear
mounted bumper whips. Perhaps a better use of their linears - as
legal power won't light this circuit.

On review of the circuit (having neglected the capacitors) it looks
more like a lower rate in a somewhat haphazard logic race of a
relaxation oscillator whose RC (1K-101K times 0.01ï¿½F) still makes this
wobbulate at higher than visible rate (or lower than perceptible
brightness, take your pick).

Ahhhh, Richard, your armour and weapons rattle as you come down the hall...

Well, it doesn't flash, and it does seem to work... albeit in a bit of a
"sloppy" fashion (tuning is sloppy as to light changes in the REF led)...
and you are correct, the 100k (and the 1k is there in series too) is barely
enough to keep from burning out the leds and a kludge...

If you HAD to make this circuit work, I am interested, and certainly I think
you of an intellect capable--what changes would you make--keeping as much of
the original circuit as possible?

Warmest regards,
John

Hi Brett,

How could you tell? Everything about this is far too fast for the eye
to perceive. But we let that pass.

>and it does seem to work... albeit in a bit of a
>"sloppy" fashion (tuning is sloppy as to light changes in the REF led)...
>and you are correct, the 100k (and the 1k is there in series too) is barely
>enough to keep from burning out the leds and a kludge...

Barely enough? The problem is it is far too much. You would have to
pump 3KW (matched) through this SWR meter to run the forward LED at
rated current.

The eye is a miserable detector of absolutes, and what you perceive as
bright with whatever current is eking its way through the circuit, is
a sad comparison to what the LED could support. The proper comparison
is done by what is called optical pyrometry, but then that is the
wrong kind of balance for this application.

>If you HAD to make this circuit work, I am interested, and certainly I think
>you of an intellect capable--what changes would you make--keeping as much of
>the original circuit as possible?

Research the "Bruene SWR meter" to find out where you went wrong in
the circuit topology. If you are going to substitute LEDs for meters,
take heed that they are power indicators, not current indicators.
This is some advantage in one sense, and a divergence from the
standard presentation in another sense. Not keeping track of the
sense can get your necktie wrapped around the axle. Mixing LED types
like for Green forward power and Red for reverse power (or t'other way
'round) can really gum up the works when it comes to sizing other
component values.

A simple test of how confounding the eye can be is found in the
question:
"How bright can the Red be in proportion to the Green?"
By the simple electronics, this is a slam dunk. By appearance from
those same electronics, you are off by two orders of magnitude. By
conversion efficiencies there are still major errors of appearance.
Once you get all these balanced out, you still have to answer the
question whose psychology will still perturb most users. Try writing

the answer for a User's Manual (the ultimate test of functionality).

From: Rick Frazier <rickf@rickfrazier.com>
Message-ID: <427882FF.C62E5004@rickfrazier.com>
Source record: 77810

Alex:

If you use insulated wire to make up the ladder line, it doesn't matter quite as much if the wood dowels conduct a little when wet... On the other hand, why not use 1/2" drip line tubing? It's easy to cut, not too bad to drill, and if you cut little v-shaped notches to the drill holes (or punch them) you can just "snap in" the wire. There's a fellow that sells ladder line made this way (insulated wire snapped into dripline tubing spreaders) and it works great. He also sells G5RV antennas so a search on G5RV may net you the guy... (Don't remember at the moment, and am in the middle of an endless move from a large house to a small rental while we build the new QTH. Not fun, and my time is extremely limited for the next week or so at least...)

Thanks

The group there are truck drivers, when speaking to truck drivers a
much
different form of speech is chosen than in other groups... ....

All CB'ers are truck drivers? I know a few truck drivers, and I didn't
need an interpretor... The ones I know seem to speak english.
Are you talking to Iranian truck drivers? I doubt they use many CB's...
Most prefer to bootleg on VHF using ham tranceivers....Kinda the
3rd world "family radio"....

Indeed, if you look in the above postings, of mine, in this group, you
will
find I have expressed these same ideas here--with gentler nouns, verbs
and
text...

I've read your rantings at both places....All in all....I still think
you
must have been an abused child...You seem fairly silly at either
group...gentle or not...BTW....What is this great "mis-information"
we hams have supposably foisted upon the world? I read that post....
Sillyness it was...You don't need to be a ham to foist
misinformation...
You can go back to barking at the moon now....
BTW, Don't worry. I'm not going to argue with you...
I fear it would be too painful for you to cope with.
I wouldn't want you to go "postal" on us, or anything....I remember
once on 75m, they picked on this dude for so long, he went postal
and shot his wife to death out of sheer frustration. No joke....
It was on the frequency I talked on at that time...Some out there
may still remember it....He was a "4" lander....Was about '85 or so...
He may still be serving time for it... So you can see my concern.
I wouldn't want you to end up like that. I've argued with some people,

and they started barking at the moon out of frustration. You already
bark at the moon, so I'm afraid I could be fatal to you...:(So I'll
leave
you alone....Resume barking now....

The original article describing the "Field Day Special" antenna can now be downloaded from http://eznec.com/Amateur/Articles/Field_Day_Special.pdf. Or you can find it and other articles listed at http://eznec.com/Amateur/Articles/.

The "Field Day Special" has been a favorite of mine for more than 20 years. Quite a number of other people have built them, and reports I've received have been uniformly favorable.

No..I don't think Houston is too far. We have one check-in already from
EM22ts near Jefferson,TX If I recall that beam of yours is a vertically
polarized beam. Practically 100% of the 2M SSB ops use horizontal antennas.

My suggestions?
1. Mount your beam horizontally
2. Tweak it in on 144.240
3. Use max power for that antenna (50w?)
4. Wear headphones
5. Use a GaAsFet pre-amp
6. Listen,listen,listen
7. We have a good station in Vicksburg,MS KJ5RC,Carolyn (EM42) that can
listen for you during the net and relay you in if the band is poor. Try
calling her on 144.200 sometime and see how it goes. If the band is poor she
may be your way to check-in via relay.

Thank you for your interest.

I would like to build my own, I just need to figure out where to get the parts from. Again I did not see any thing on that site so far. The one I bought so far does not seem to make too big a dif so far. And all the cust service responses from various cell phone antenna sites say there is not much for 900,1000, 1100 mhz which is what the specs say on the phone. And yes I am a layman for this but willing to learn what I can if only for the knowledge.

2054. impedance of end fed half wave antenna

From: Andreas Magun <magun@mw.iap.unibe.ch>
Message-ID: <4278d19d$1@news.unibe.ch>
Source record: 77819

I am planning to use QRP with a half wave length end fed antenna at 40 m
on a trip into desert country. What range of impedances is to be
expected with the fed end near ground and the other end between
3 and 10 m above ground? Another option would be an end fed inverted V
with the same range of center heights.

Or would be better to use a center fed inverted V with its low
impedance that can be mathed with smaller losses to 50 Ohms?

What would be the best (mimimum loss) tuner for an end fed antenna?

Thanks for your help

Andreas

That`s reasonable. Cell phones communicate with whichever base station works best in a wide network. This is almost the ultimate space and frequency diversity system. Antennas are low which limits range. No problem as contact is lost it is immediately re-established automatically with another station, the new best choice.

As azimuths between phones and bases are constantly changing, concentrating phone energy at a articular azimuth does not make sense if the phone is moving.

Efficiency makes sense. Concentrating energy along the horizontal makes sense for most users.

You are not reading SWR. All you are reading is net current.
Both LEDs have the same rectified net current through them.

> Well, show me what is wrong and suggest an alternative circuit or mods to

Here's the last one I looked at:

http://www.mfjenterprises.com/man/pdf/MFJ-974H.pdf

You'll recognize the SWR circuitry at the input connector. Note
the capacitive dividers. That's what your circuit is missing.
Nowhere does your circuit sample the RF voltage.

This type of SWR meter samples the RF voltage (using a capacitive
divider) as one parameter. It samples the RF current (using the
toroid) as the other parameter. The two parameters are added before
rectification to obtain the forward power. The two parameters are
subtracted before rectification to obtain the reflected power. The
phasor addition and subtraction must be done before rectification.

Well, If there is a voltage, there is a current (albeit, at times very small)--the opposite is also true, ohms law is standing proof...

Why can't I measure the standing wave ratio as a ratio of power, as opposed to voltage or even current reflected... the three are tied together, isn't it impossible to separate any one from the other two (and, I mean in reality, NOT in theory)--even though at times one can appear as insignificant to an observer?

I see the design I sketched as an SWR device, perhaps not VSWR, or ISWR--but, PSWR...

What would favor choosing the voltage device over the current or power SWR devices?

Or, am I imagining something?

Warmest regards,

John

live, mercy sakes good buddy guaran-toled ye thar, kick hit back thar wid
that 'ere 'far' in th' war (wire), an' we just got down".(What the hell is
THAT anyway?) BEEEEEP SQUEEEEEEEK!

(We got all them 'ere bird watts thar to git out 'ere wid)

This whole thread is just hilarious! I am honestly enjoying it! LMAO! The
whole concept is just ludicrous. And the whole argument is an obvious troll
designed to get hams all worked up. But I have been reading it and giggling
all the while. So while I don my flame suit, forgive me while I snicker and
post equally silly comments. And something to think about.

CB radio COULD be a good thing, that is true. However, it has no status in
the Federal scheme of things WRT disaster or wartime communications. It is
simply not taken seriously and I think the author of this thread knows this-
AND how to push buttons to get people riled up. Let's face it, guys, it's
reputation stems from the Smokey and the Bandit days and the 70's
faddishness of CB that has fallen by the wayside. CB radio today has no
structure, no organization, and no discipline, all of which would be needed
to provide worthwhile communications support to
FEMA and gov't officials in the field. That could only take place if CBers
returned to some of the activities they once supported. National
recognition of CB radio won't come overnight, if, indeed, it ever did. But
in order to reach such a goal, one would have to start small and at the
local level. Organize clubs who raise funds for local charities and provide
communications and aid stations for
walkathons and fundraisers. Form auxiliaries to rescue squads and fire
departments. For example, during brush fires and large fire events and

disasters, provide bottled water to firefighters and sandwiches. Determine ways that CB clubs and auxiliaries can be of help--even if it doesn't necessarily mean you have a mike in your hand. Define objectives and purposes for your club. Make public affairs a part of your club so the local paper knows what you are doing to help. Reach out to other nearby cities and towns and get CBers in those towns to do what you are doing. Community involvement doesn't HAVE to be
radio-related, but it can certainly HELP as it forms a cohesive core around which to serve the local community.
Perhaps this will spread from just a few local clubs to a regional group with a newsletter with articles on how to help your community, then to some sort of national organization that provides training in weatherspotting (NOAA) to radio procedures for handling radio messages and how to support authorities and know their needs. Someone will have to have that vision at some local level and it will have to spread from that grassroots level.

As it is, CB radio is a ragtag, technologically hamstrung, untrained and undisciplined group that provides NO effective support. Period. That is just a fact, Jack. It COULD be much more, but it has a lot of baggage to overcome. What was left after the 70's fad was the outlaw operator with his "leenyar" and "extree" channels and disrespect for the law that is seen by trained professionals AND the Amateur community as sort of a lowball group of ruffians that are not to be taken seriously.
How many CBers, dedicated and died-in-the-wool CBers, can legally and effectively talk directly to FEMA? From Virginia to California, from Colorado to Florida right NOW if something happened? They cannot. *Certain* authorized Amateurs and MARS (ham) stations can. And their communications fit right into the military style of voice protocol and both recognize the information being passed. There are such stations scattered thru out the USA. They are there to serve in time of need. I will say no more for obvious security reasons (frequencies, etc). When a message needs to get into or out of New York right NOW, would CB radio do the job? Absolutely not. Your 'leenyar" and "extree" channels would not help, indeed, your efforts would make things WORSE-not better. Hams whose tendencies lean towards volunteer service already train to do this job and, as such, they are supported by the authorities and the Federal gov't with funds designated by the Dep't of Homeland Security to go to ARRL for that purpose. (And, yes, I CAN find the link.)

This whole troll thread is just another way to fuel the "war" of CB vs Ham. This is not good. There is a right way to do something and a wrong way. Ham radio already serves Nations and has for nearly 100 years. CB is a johnny-come-lately--even a wannabe--something that, yes, COULD be an asset. But is simply not serious, nor is it now taken seriously to any extent. It is a TOY that is technologically out of date and even could be said to be irrelevant and obsolete. But as I have said in this long discourse, it COULD be a great thing IF.....
The "IF" is up to the users.

Flame on.....

Message-ID: <kS7ee.49$PO5.2012213@news.sisna.com>
Source record: 77681

Well, I should have stated my goal with this "eccentric device."

I wish an indication of SWR which is cheap, uses fewest parts possible, and has the possibility of "automatic operation" and one can be placed on each and every antenna I am playing with (or anything else, maybe one on the bird fountain! <grin>)...

I bought a box of these LEDS at a surplus dealer, 10,000 LEDS in the main box, with 10 sub-boxes, each containing 1,000. They are a yellow/orange color--unique color to most I have seen...

They seem to handle 20 ma for days on end with no problem--they are VERY bright at 5 ma (at least as bright as a "standard issue LED" at 10-20 ma)...

The info on the box is as such:
SIEMENS COMPONENTS
Made in Malaysia
LOT NO. 72870422
PART NO. Q6270303638
PRODUCT ID. LY 5436-TO
DVP NO. 2605-9491-01
D/C: 9716
PROD NO. 97700420

I have done nothing but use them, have not even taken time to drop a VOM on 'em and measured the voltage drop across one--they are my favorite for projects (well, I am cheap and have a FEW of 'em!!!)....

My design criteria are:
1) CHEAP!
2) Cheap!
3) Few parts...
4) At least marginally workable...

Warmest regards,
John

| Hi Brett,
|

| A most unusual indicator if ever I've seen one (and I've seen many).
|
| What you have (if you can generate enough voltage - it will take about
| 35-40W of transmit power) is an emergency flasher weakly lighting the
| alternate LEDs at an HF rate.
|
| This is with Red LEDs, as I offered in another posting, if you tried
| with Blue LEDs, you would need more like 170W to weakly light them.
|
| The 100K is literally useless (as are the 1N914s), and the 1K is a
| severe handicap. Once you get past those limitations you will have a
| brighter flasher at no big hit to the overall efficiency - if a
| flasher is what you want. Mad Man Muntz with his dikes would have a
| glorious time trimming back the excess here.
|
| It might sell well to the CB crowd that wants 27 MHz strobing brake
| lights. Could even perform better for night time DX than some rear
| mounted bumper whips. Perhaps a better use of their linears - as
| legal power won't light this circuit.
|
| 73's
| Richard Clark, KB7QHC

This is the most important question of your life.

The question is: Are you saved?

It is not a question of how good you are,
nor if you are a church member, but are you saved?

Are you sure you will go to Heaven when you die?

The reason some people don't know for sure if they
are going to Heaven when they die is because they
just don't know.

The good news is that you can know for sure that
you are going to Heaven.

The Holy Bible describes Heaven as a beautiful
place with no death, sorrow, sickness or pain.

God tells us in the Holy Bible how simple it is
to be saved so that we can live forever with Him
in Heaven.

"For if you confess with your mouth Jesus is Lord
and believe in your heart that God raised Him from
the dead, you WILL BE SAVED." (Romans 10:9)

Over 2000 years ago God came from Heaven to earth
in the person of Jesus Christ to shed His blood
and die on a cross to pay our sin debt in full.

Jesus Christ was born in Israel supernaturally to
a virgin Jewish woman named Mary and lived a sinless
life for thirty-three years.

At the age of thirty-three Jesus was scourged and
had a crown of thorns pressed onto His head then
Jesus was crucified.

Three days after Jesus died on a cross and was placed in a grave Jesus rose from the dead as Jesus said would happen before Jesus died.

If someone tells you that they are going to die and then three days later come back to life and it actually happens then this person must be the real deal.

Jesus Christ is the only person that ever lived a perfect sinless life.

This is why Jesus is able to cover our sins(misdeeds) with His own blood because Jesus is sinless.

The Holy Bible says, "In Him(Jesus) we have redemption through His blood, the forgiveness of sins..." (Ephesians 1:7)

If you would like God to forgive you of your past, present and future sins just ask Jesus Christ to be your Lord and Saviour.

It doesn't matter how old you are or how many bad things that you have done in your life including lying and stealing all the way up to murder.

Just pray the prayer below with your mouth and mean it from your heart and God will hear you and save you.

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven with You when I die. I agree with You that I am a sinner. I believe that You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins and that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thanks Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

Welcome to the family of God if you just allowed God to save you.

Now you are a real Christian and you can know for sure that you will live in Heaven forever when this life comes to an end.

As a child of God we are to avoid sin(wrongdoing), but if you do sin the Holy Bible says, "My dear children, I write this to you so that you will not sin. But if anybody does sin, we have one who speaks to the Father in our defense Jesus Christ, the Righteous One."

Those of you that have not yet decided to place your trust in the Lord Jesus Christ may never get another chance to do so because you do not know when you will die.

Jesus said, "I am the way, the truth and the life: no one can come to the Father(God)(in Heaven), but by me." (John 14:6)

This means that if you die without trusting in Jesus Christ as your Lord and Saviour you will die in your sins and be forever separated from the love of God in a place called Hell.

The Holy Bible descibes Hell as a place of eternal torment, suffering, pain and agony for all those who have rejected Jesus Christ.

The good news is that you can avoid Hell by allowing Jesus Christ to save you today. Only then will you have true peace in your life knowing that no matter what happens you are on your way to Heaven.

Praise the Lord!
Servant of the Lord Jesus Christ

Message-ID: <r48ee.50$SO.2216977@news.sisna.com>
Source record: 77683

Well, my appearance may indeed be one of a troll--except to myself...

But I can assure you, it is much worse a problem than that--I honestly believe what I put to text!!! The arguments I have heard, to date, have not swayed me, much... indeed, I feel I am at a game, half root for one team, half for another...

And, I broke that thread in question, away from another, where the whole context of the discussion was beginning to center around "CB worship" as opposed to "amateur worship", and it was quite obvious that hams were "stirring chit" (my opinion only), because it is "funny" to take advantage of a few petty people and bring a whole conversation to a halt--now that is MY interpretation of a "TROLL!"

Warmest regards,

John

that
| > on a daily basis.
|
| <snip>
|
| ....kinda like treason, right? Giving aid and comfort to the
| enemy! LMAO!
|
| I can see it now: "Tan fer thar, we is a-standin' by thar to copy thar
'ere
| 'eee-mer-gen-cee' thar on 11 Meters thar, shore thang thar, gre't day
'live
| live, mercy sakes good buddy guaran-toled ye thar, kick hit back thar wid
| that 'ere 'far' in th' war (wire), an' we just got down".(What the hell is
| THAT anyway?) BEEEEEP SQUEEEEEEEK!
|

| (We got all them 'ere bird watts thar to git out 'ere wid)
|
| This whole thread is just hilarious! I am honestly enjoying it! LMAO! The
| whole concept is just ludicrous. And the whole argument is an obvious
troll
| designed to get hams all worked up. But I have been reading it and
giggling
| all the while. So while I don my flame suit, forgive me while I snicker
and
| post equally silly comments. And something to think about.
|
| CB radio COULD be a good thing, that is true. However, it has no status in
| the Federal scheme of things WRT disaster or wartime communications. It is
| simply not taken seriously and I think the author of this thread knows
this-
| AND how to push buttons to get people riled up. Let's face it, guys, it's
| reputation stems from the Smokey and the Bandit days and the 70's
| faddishness of CB that has fallen by the wayside. CB radio today has no
| structure, no organization, and no discipline, all of which would be
needed
| to provide worthwhile communications support to
| FEMA and gov't officials in the field. That could only take place if
CBers
| returned to some of the activities they once supported. National
| recognition of CB radio won't come overnight, if, indeed, it ever did. But
| in order to reach such a goal, one would have to start small and at the
| local level. Organize clubs who raise funds for local charities and
provide
| communications and aid stations for
| walkathons and fundraisers. Form auxiliaries to rescue squads and fire
| departments. For example, during brush fires and large fire events and
| disasters, provide bottled water to firefighters and sandwiches. Determine
| ways that CB clubs and auxiliaries can be of help--even if it doesn't
| necessarily mean you have a mike in your hand. Define objectives and
| purposes for your club. Make public affairs a part of your club so the
local
| paper knows what you are doing to help. Reach out to other nearby cities
| and towns and get CBers in those towns to do what you are doing.
Community
| involvement doesn't HAVE to be
| radio-related, but it can certainly HELP as it forms a cohesive core
around
| which to serve the local community.
| Perhaps this will spread from just a few local clubs to a regional group
| with a newsletter with articles on how to help your community, then to
some
| sort of national organization that provides training in weatherspotting
| (NOAA) to radio procedures for handling radio messages and how to support
| authorities and know their needs. Someone will have to have that vision at
| some local level and it will have to spread from that grassroots level.

|
| As it is, CB radio is a ragtag, technologically hamstrung, untrained and
| undisciplined group that provides NO effective support. Period. That is
| just a fact, Jack. It COULD be much more, but it has a lot of baggage to
| overcome. What was left after the 70's fad was the outlaw operator with
his
| "leenyar" and "extree" channels and disrespect for the law that is seen by
| trained professionals AND the Amateur community as sort of a lowball
group
| of ruffians that are not to be taken seriously.
| How many CBers, dedicated and died-in-the-wool CBers, can legally and
| effectively talk directly to FEMA? From Virginia to California, from
| Colorado to Florida right NOW if something happened? They cannot.
Certain
| authorized Amateurs and MARS (ham) stations can. And their communications
| fit right into the military style of voice protocol and both recognize the
| information being passed. There are such stations scattered thru out the
| USA. They are there to serve in time of need. I will say no more for
| obvious security reasons (frequencies, etc). When a message needs to get
| into or out of New York right NOW, would CB radio do the job? Absolutely
| not. Your 'leenyar" and "extree" channels would not help, indeed, your
| efforts would make things WORSE-not better. Hams whose tendencies lean
| towards volunteer service already train to do this job and, as such, they
| are supported by the authorities and the Federal gov't with funds
| designated by the Dep't of Homeland Security to go to ARRL for that
purpose.
| (And, yes, I CAN find the link.)
|
| This whole troll thread is just another way to fuel the "war" of CB vs
Ham.
| This is not good. There is a right way to do something and a wrong way.
Ham
| radio already serves Nations and has for nearly 100 years. CB is a
| johnny-come-lately--even a wannabe--something that, yes, COULD be an
asset.
| But is simply not serious, nor is it now taken seriously to any extent. It
| is a TOY that is technologically out of date and even could be said to be
| irrelevant and obsolete. But as I have said in this long discourse, it
COULD
| be a great thing IF.................
| The "IF" is up to the users.
|
| Flame
on...

John (Smith), all you have is a circuit which might light up a couple of light-emitting diodes from an RF source via a current transformer. What purpose is served by the 100K resistor is anybody's guess. But it has nothing to do with SWR.

As Cecil implies, you should go right back to square one and think about it.

Actually, you are in good company. Most people don't know how their SWR meter works or what it does. Most people and Tx manufacturers don't connect it in the correct place for it read SWR on the transmission line. Consequently it doesn't even indicate SWR and its name is a very misleading misnomer.

All it indicates is the magnitude of the reflection coefficient of the load on the transmitter relative to the impedance the transmitter is designed to see. And it only does THAT provided the meter has itself been designed to cater for the same impedance. It is fortunate there exists a standard impedance of 50 ohms.

But don't allow me to put you off. Just obtain a circuit diagram of a so-called SWR meter (an HF version) from a handbook and, with little more than Ohm's Law, you can see and work it out for yourself.

Reg, G4FGQ.

The resistance in the anode circuits of the LEDS only serves as an attempt at limiting the current through the FWD LED to full brightness (and a constant current source would best replace this)--and to keep it from "burning out."

My goals are this:
1) CHEAP!!
2) Cheap!
3) Fewest possible parts...
4) Marginal functionality...

I want to be able to cover the world with these devices (put one on every single antenna project of mine (even the EH Antenna!!! <grin>)

I will continue to toy with the design as my time permits....

I am quite willing to suffer the slings and arrows of others, education is expensive yanno!!! And, I do see most, if not ALL, are saying there is much more to SWR than at first it seems...

Thanks Reg...

Warmest regards,
John

Yes, but the amplitude and phase relationship of current to
voltage can have any possible value and there are an infinite
number of possibilities. In the equation, Z = V/I, you cannot
determine Z unless you know BOTH V and I.

> Why can't I measure the standing wave ratio as a ratio of power, ...

You need both voltage and current to determine power. Your design
senses only current.

The inability to read pdf files is a major disadvantage. Much web content is posted in this format. If you're able to download files from the web, it can be downloaded and viewed with the free Acrobat reader; if you're not able to download files OR view pdf files, you're missing out on a great deal of what the web has to offer.

There is no best antenna for Field Day. The Field Day Special is ideal for me because I usually backpack all my equipment, which precludes rotatable antenna and puts a big premium on weight. The FD Special is very light weight and its pattern just covers the majority of the U.S. from here on the West Coast, giving the highest possible gain consistent with the coverage I need. Most Field Day participants neither backpack nor operate from the West Coast, so different criteria apply. The antenna might be useful to others for either Field Day or fixed location use because it's inexpensive, provides a good F/B ratio, and can easily be switched to reverse direction. On the other hand, it's a single band antenna (which can be designed for any single band). But it would be a lousy Field Day antenna to use from, say, Ohio or anywhere near the middle of the population concentration of the U.S.

OK. Perhaps here the problem lies....

I am looking at it like this:
I don't care what value is V, nor what value is I...
I care only how much power the antenna is radiating, and how much is "reflected" back and sits on the plates, collectors, or drains and is wasted as heat--develops itself on the feedline--radiates from other antenna components--etc....

I am thinking the "directional coupler" is doing that action, and forcing the amount of "forward" power to one LED (amount of power actually leaving the antenna (allowing for losses)) and giving indication--and the "reflected" to the other LED (the amount of power "wasted") and giving indication...
I take for granted that when 'Z' of "output of xmtr" = coax = antenna input, I see the "REF LED" at dark condition....

There WELL may be an error in my thinking and, the "thing" (frankenstein?) I have constructed only "seems" to work... (kinda like time yanno <grin>)

Thanks for your patience Cecil....

Warmest regards,
John

John Smith wrote:
"Kinda the 3rd world "family radio" (Ham VHF)."

CB is much more valiable than Amateur Radio because it can be legally used for profit as well as for pleasure. FCC rules prohibit amateur radio use in profitable pursuits.- It`s FCC protection for broadcasters, common carriers, and other radio services.

Pubkic protection agencies make a business of preparedness for disaster and give mostly lip-service to cooperation with hams. Amateur radio may be competition for homeland protection. Professionals may not need amateur help. You can`t pay amateurs to be ready, so you can`t order them to do anything.

Best regards, Richard Harrison, KB5WZI

<assemblywizard@gmail.com> wrote:

>The resistance in the anode circuits of the LEDS only serves as an attempt
>at limiting the current through the FWD LED to full brightness

It, in fact, serves to reverse bias the other LED, turning it OFF
(until the first LED depletes the capacitor which then reverses the
situation - the original RDL flip-flop running asynchronously). Which
one lights up is a matter of an indeterminate logic race, not some
proportionality of powers.

>(and a constant current source would best replace this)--

If you think about this statement, you would recognize that
either/both LEDs would always be ON and equally bright. [the word
"constant" should be a dead give-away]

>and to keep it from "burning out."

Then you put a current limiter (not constant current device) in EACH
LED lead (not sharing). To select a 1KOhm limiter presumes a 20V drop
across it for a 20mA LED excitation current (a typical current
specification). You may achieve the 20mA limit, but it will come at
the cost of more than 40V across 100 Ohms backing through the current
transformer (it is NOT a directional coupler) which can only be
supplied by a transmitter excitation of several KW to a matched load.
If you did nothing other than simply connect an LED across the current
transformer's terminals and adjust the transmitter for 20mA through
the LED, you would need 8W into a matched load.

To put it simply, you are fixated on a problem so remote from your
goal, that solving it basically accomplishes nothing towards measuring
(or even indicating) SWR. As several suggestions have been offered to
research a real topology, you might want to pursue that first.

Got just the device for you on page 520 of "The radio amateur's
handbook", 1957 by the ARRL. It's called the "twin-lamp" and
consists of a piece of 300 ohm twinlead and two flashlight bulbs.
I used one in 1957 on my all-band off-center-fed dipole. I ran
40 watts on 11m in those days. :-)

You might want to take a look at another type of design for SWR
meters. There is one that uses a short piece of slotted line
with two parallel conductors that separate the forward and
reflected components without phasor addition/subtraction.
Here's a schematic of the Heathkit HM-11 SWR meter.

http://www.qsl.net/kb7rgg/heath/schematics/heathkit_schema_hm11.gif

Note the low component count. The only tricky part is the slotted
line but that is a mechanical problem, not an electronics problem.
Resistors R1 and R2 attenuate one wave in one direction leaving the
other wave in the other direction to be rectified by d1 and d2.

Hi All,

There is a very simple solution. Google will convert the PDF to HTML
once its robot reads the page. It has been doing this for several
years now.

How long it takes for Google to revisit the site to accomplish this is
another matter (not generally very long though).

Well, that is how my "meter SWR" which I constructed looks all right--but I wished to get away having to construct a directional coupler from tubing and pickup loops...
Only, my (metered) SWR meter uses just ONE pickup loop, I switch terminating 50 ohm resisistor and take-off ends and use the single loop for BOTH "FWD" and "REF", with a physical switch--my thinking was it would keep the device more "balanced" using the same pickup...

Warmest regards,
John

Hi Brett,

Another Watt soaker (you better use 5W 50 Ohm resistors if you don't want blisters or burnt LEDs) - that is, if the caps (basically useless) don't turn off the LEDs. You will need to pour the power to a matched load to light them up (very poor low end sensitivity from pretty feeble LEDs).

You could as easily throw away all the resistors and caps (and the so-called constant current source), or at least replace the resistors to 1/10 value straight to ground.

I thought you wanted cheap?

A toroidal pickup samples the current at one point. Knowing the
current at one point tells you absolutely nothing about SWR.

Hi Brett,

I've no doubt, but in your circuits - never. Doesn't make sense
unless you need parts ballast. It's like when the watchmakers
advertised watches with 60 jewels, and there were only half a dozen
points that actually used them.

There's a lot of research going on for 'smart' antennas that effectively are just electronically phased arrays that continuously re-tune themselves to 'lock on' to a base station. Neat idea, with the usual benefits of potentially less power for a given range, better range for a given power, etc., but I don't know whether or not any commercial phones employ the idea yet.

Well, the amplitudes aren't equal!!!

Darn heathen CB'ers are not civilized enough to cut the 400+ watts back to 10 watts when that would suffice for the QSO--and that darn MIC GAIN!!!, yanno, someone has got to talk to them about the virtues of speech compression, but it does assist in finding them over a few Mhz (well, that might be exaggerating!!!!! <grin>)

Warmest regards,
John

Hi, Cecil -

I think he thinks his toroid is a directional coupler.

Richard:

I just climbed up and pulled the SWR meter off the pole--DUH!!! Those 50 ohm resistors are actually 1500 ohm 2 watt metal oxide.... sorry, as usual, your post was relevant.... I just couldn't see it till I opened up the box....
I could have sworn I stuck 50 ohm ones in there--getting old here... but now I can see it, if they had been 50 ohm, power to the ant would have been really limited.... and I would have "smoked" that winding and resistors...

Anyway, will try to get sometime to toy with it tomorrow, and paste the "real" schematic of it on the webpage....

Warmest regards,
John

Cecil, W5DXP wrote:
"Knowing the current at one point tells you absolutely bothing about SWR."

The reflection coefficient depends on a mismatched load at the end of the line. Reflection coefficient is more or less constant in a low loss transmission line.

Bird`s Model 43 does not contain a toroid, but it does sample the current at a single spot.

Just as its forward and reverse watt indications can be scaled to SWR readings, it could be calibrated to indicate SWR and scaled to give watts.

Forward and reverse power flows on a line are nearly constant, except for slight line loss, no matter where the line is sampled.

The design trick in the Model 43 is making samples derived from amps and volts exactly equat to each other. So, when their polarity is the same, their total is double the value of either by itself. When their polarities are reversed from each other, they cancel completely.

It so happens that a reflected wave always undergoes a reversal of polarity of either its volts or amps, but never both. This is the distinguishing difference between the forward wave and the reflected wave.

The phase reversal of the reflected wave, makes its sample of volts and amps in the 43`s directional coupler (sampling unit) cancel, while the sample of the forward wave has double the magnitude of either sample, volts or amps, by itself. This permits a reading proportional to forward power only.

To get an indication of the reflected power alone, it is necessary ro flip a switch (in the Model 43, this is reversal of the slug`s direction). This switch reverses polarity so that now the forward power samples cancel and the reverse (reflected) power samples produce a double of either of their values alone.

Bird gets very satisfactory results without a toroid. Using only a small pickup loop inside the sampling element to sample the line current is enough. Line voltage is sampled by this tiny coil`s capacitive coupling to the precission short 50-ohm line segment inside the meter case.

In normal low-loss transmission lines the forward power is the same at either end of the line. Same for reflected power. So it makes no

difference where they are measured in the transmission line.

Best regards, Richard Harrison, KB5WZI

I became aware of that sort of adaptation by reading a notice from the IEEE Houston Section of an appearance that Cecil`s old professor at Arizona, Balinas (sp?) was going to make here to clue the locals in on the latest developments in adaptive antennas. Unfortunately, I didn`t go. I`ll have to learn elsewhere.

It also samples a voltage which John's design does not.

I left out a word that I thought was implied. I should have said:
Knowing *only* the current at one point tells you absolutely nothing
about SWR. He is sampling *only* the current and *only* at one point.
Either two current samples, a current and voltage sample, or two
voltage samples are required for an SWR reading.

web site needs to be better

2116. Re: CB Radio is MUCH more valuable than Amateur Radio...

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-05 06:07:59 UTC
From: nm5k@wt.net
Message-ID: <1115273279.828615.59930@o13g2000cwo.googlegroups.com>
Source record: 77731

CB is much more valiable than Amateur Radio because it can be legally
used for profit as well as for pleasure. FCC rules prohibit amateur
radio use in profitable pursuits.- It`s FCC protection for
broadcasters,
common carriers, and other radio services. ....

None of this matters in smaller third world nations though....Most
people
I see on TV, in say Iran, Afghanistan, africa, etc, etc, are using
VHF Handie talkies most of the time. I never see them using CB's,
although, I guess some do...But I've seen icom HT's on CNN, many
a time, when seeing video of people over there...I would think they are
working simplex...Most all soldiers I see with radios are using icoms,
etc...
I don't think CB is real popular, although maybe there are a few...
As far as I know, CB is mainly a USA conceived band...If others use it,

it's just cause they adopted it to use existing radios being built...
As far as the debate as which is better, to me it's a non issue...I can
use
either, or both...But to *me*, ham radio is much more useful than CB
could
ever think of being...Just the restriction of being in a small single
band is
enough to kill it, being as skip is only good about 50% of the
time...So,
yea, I could talk across town, but maybe nowhere else...With ham radio,

I can talk to nearly anyone, one way or the other, if they can match
bands
with me. Being able to work 160m-70cm with a single radio smokes
being able to work only 11m with a single radio... If we had a major
emergency, which for us in Houston, will almost certainly be a
hurricane,
I bet ham radio will be much more useful overall, just due to the shear
advantage of mucho more spectrum, and types of propagation.
And many locals on VHF are already into skywarn, etc...So 2m is a
natural for the hams locally...They are prepared for it.
But...
Having a CB would be better than nothing at all....I don't have the
problem
of looking down on CB...To me, it's just another band, under different
regs...I give them about as much thought as I do the cell phone band...
I might tune across 11m, maybe once every two months or so, when
checking cdx....It's actually usually fairly dead around here...For

that
reason, it could actually be fairly useful...Very few "average" people
have CB's like they used to...Most CB'ers now, are fairly hard core
CB'ers....And people that actually use them like truckers, and people
way out on ranches, etc....You go out in west texas, and there are
still
a few ranchers that use CB to yik yak...It's like their local party
line...
But myself, I prefer 80/40 meters for local/regional use...40 in the
day,
80 at night...Or 160 too....I could talk three blocks away, to
Galveston,
and relay to Austin, all on the same band as a scenario...CB....Three
blocks, yes...Galveston, hummmm....Not very well...Would need a good
antenna, and big leanyer...Austin...SOL, unless it's a fluke of
nature....
I know which line I'll be in.....BTW....Many truckers agree, and are on

80/40....They know what really works...Just most truckers don't have a
ham ticket...I think the numbers are increasing though...They can talk
to
their families anywhere on the road, if the YL, etc is a ham...
CB won't do that very often...Skip zone is too long, and it will always
be
a crapshoot for regional use. I use the bands that best match the path,

time of day. Way more reliable. I can get on 80/40 right now and talk
to
Dallas, or any other city in the country. Even from my truck.
No if's, ands, or but's....nearly as reliable as a telephone... In some
rare
cases, the MUF may drop way low, and 160 would be the better choice.
CB won't talk to Dallas from Houston very often at all...CB is CB. No
more,
no less...I suspect if "John Smith" actually has a ticket, it's no
code....And
no HF, unless maybe he has an old novice...I can't see a reason to
complain if he actually had use of those other bands. Only people who
have some kind of inferiority complex bark at the moon about something
as
trivial as CB vs Ham radio...Maybe we should develop a cb/ham therapy
course to deal with all the problems of coexistance. We could have them
at ham fests, etc...Hams and CB'ers could have group encounter sessions
to iron out their problems...Get all touchy feely, and hug each
other....
Of course, I won't be there....Sounds too gay to me....:(

definition of it was, "Time is a measure of change; if nothing
changed, you couldn't assign time to it."

>

Average power is nearly constant, but for every value of SWR > 1:1, peak power along the line is not. I have seen many examples in FM broadcast stations where their transmission line was damaged at intervals of 1/2 wavelength due to a high mismatch at the antenna, or a precipitating failure in the line itself.

Current maximum points are prone to overheating. Voltage maximum
points are prone to arcing.

I know.

2127. Slightly OT. DIY Car Aerial splitter

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-05 14:15:59 UTC
From: john <ee@ee.com>
Message-ID: <zUpee.28854$Cq2.21742@fe2.news.blueyonder.co.uk>
Source record: 77742

A appreciate that this maybe slightly OT, but I am sure someone here can help.

I have a GPS reciever that also recieved RDS broadcasts (i.e on a standard FM frequency)

The current GPS unit uses a single wire with a phono type plug as an antenna.

As an alternative there is a "Y Adapter" avaliable that plugs inbetween the radio and aerial which gives the GPS unit the use of the main car antenna (improving reception). See links below. The official splitter costs around 35 Euro, but I am sure that there is not much to it and a DIY solution would work.

Can any recommend the best way to go about this? to provide the GPS unit with a decent aerial feed?

Hi Brett,

No.

For exactly the same reasons that have gotten you this far.

The first symptom of insanity is repeating the same thing with an
expectation of a different outcome.

Nope, it won't work. It still has the same problem of
sampling the current (and nothing else) at only one
point. The two pickup coils are reading exactly the
same current just with opposite phase. You still don't
have any means of separating the forward component from
the reflected component. Your toroid is NOT a directional
coupler - it is a current transducer.

I vaguely remember building a coaxial "slotted" line without
the slot when I was in college. We took a piece of coax,
stripped off about a foot or so of outside insulation, and
ran an insulated wire under the braid. We tied one end to
ground through a R=Z0 resistor and ran the other end
to a 1N34 rectifier. Anybody remember running a wire
under the braid to achieve an inductive pickup for
forward and reflected power?

Cecil:

Yes. That works alright!
I just like to construct them from two different diameters of copper tubing "outer I.D./Inner O.D. = ~50 Ohms" and, you know why don't ya?

It looks "kewler" when I show it to my "CB Buddies!!!" That tubing is as bright and shinny as a new penny!!! (pennies are only copper coated zinc these days, yanno--kinda like "time", NOT real) <innocent-look>

I didn't used to do that, picked that bad habit up from RICHARD!!! <grin>

Warmest regards,
John

That's really a directional coupler, not a slotted line (but you
already knew that). I vaguely recall seeing it in QST or a Handbook
back in the 1950s.

That technique was used by every SWR meter I ever looked inside of. I assume the Bruene circuit is used more often now, but I'll bet a lot of cheap SWR meters still use that technique.

Yep I use that configuration for a directional coupler/VSWR measuring device some years ago. I ran the internal insulated lines up either side of the coax (RG213) into a switch box and off to a DVM. I think I used shottkey diodes.

"i use the bands that best match the path."

The medium more or less dictates that discipline for DX.

Anywhere, not just dx...I actually don't work that much dx...
Even regional, choosing the right band is important.

H-F has lost commercial traffic to cable and satellite which are
available around the clock and calendar.

Yea, but I can't use the commercial freq's anyway...So to me, HF
is unchanged.

Even broadcasters have
satellite subscribers. They supply pictures too.. Yes, there`s amateur
TV, but it isn`t prevalent, and CBers don`t do it either.

I'm fully capable of TV. slow scan anywhere , or ATV on 70cm...
Not to mention all the other services available like wefax, data, etc..
I can do it all mobile, if I have a laptop...

Anyone who wants to contact the world anyplace at any time can get a
cell phone. The worldwide system will become compatible and pervasive.

Yea, I have one of those too....For the non radio types, thats the
best bet...

Who wants to use Morse code?

Doesn't bother me, if I needed to. But morse would not likely
be used in an emergency type deal...I'd more likely be on fone...
But if they wanna go to morse, I'm ready.. If we actually had a
hurricane,
I see myself being on 2m mainly for local stuff, but also on 80/40
doing regional welfare checks and info, liason, etc...Bout the same
as any other "emergency" like the quake in Mexico City, etc...Except,
they used 20m more, being farther away...They matched the band to
the path...

That has nothing to do with his directional coupler circuit.

But at least Bruene is willing to attach his name to his views rather
than hiding behind a pseudonym. That in itself is worthy of a certain
amount of respect.

No, you are quite correct, that paper does not... I didn't mean to infer
that, sorry if that is the way it appeared....

As to "my name", it stands for an ideal... I think that has been
misinterpreted here also... let me clarify:

"John Smith" = "Principles BEFORE personalities!"

Or, "John Smith" = "Anti-Hero Worship"... or, something like that...

I don't think if I wrote a book on that subject that I could find better
words, than "John Smith", to express that ideal... but, I can see some
explaination is necessary...

Warmest regards,
John

That's not about Bruene's SWR meter circuitry. That
argument is over the internal impedance of a ham
transmitter, a subject I would suggest you avoid
at all costs. :-)

Looking for some INFO on how to Stack Big Wheel Antennas ?

Operating Frequencies TX-421.250 to RX-439.250 ATV repeater.

Would like to feed 4 antenns with equal lengths of coax from one of the Power Splitters if possible.

I thing the stacking distance is around 16 inches.

And There is something about right hand circular and left hand circular For proper phasing.

Thanks Dave

NOW you sound like an old CS professor of mine (I think my mom talked to him--way back then--put that idea in his head <grin>)... he attempted to dissuade me from the field--it failed... and, much to the regret of some of my ex-superiors....

...now, I live in this steel cell, they shove raw meat though the hole in the door, I shove my source code out under the door, in exchange--hey, it works!. <evil grin>

Warmest regards,

John

How transmission lines work was completely and fairly simply sorted
out by Oliver Heaviside around 1875.

There's nothing complicated about it except what old-wives with
so-called SWR meters try to make of it.

John, from your circuit, if you change the direction of current in the coaxial conductor through the ferrite ring, nothing happens. Why should it?

The only thing worthy of consideration is your determined persistence.

As I have said before, as may be gleaned from other contributors, you are in good company.

Beware, the amount of effort the old wives are putting into it might give you the impression it's worth while making a patent application.

On the other hand, what with the state of expertise in the Patent Office, you may possibly succeed. But you will never get rich enough to recover your legal expenses.

Reg, G4FGQ

Are humans the only beings that "create" time?

I was out for my lunchtime jog today, around the golf course. I was watching birds take off and land in the breezy conditions. It was interesting to watch the subtle adjustments they would make, especially when coming in to land. You could see them adjusting their wings in several ways to send themselves to where they wanted to land. They would compensate for wind gusts (and lack of wind).

Point is, I cannot come up with any way in which they can cope with the randomness of the wind and land in the palce they desire without having an acute sense of time. They obviously are not counting off seconds or whatever. But they seem to land where they want to, and must be predicting it by their flight adjustments.

Yeh-- Except that you need 2 WIRES! (unless both lengths to the coax connector are the same length, from where "the wire" is at! to keep the directional coupler at the same physical place(s) when makeing measurements) As power is induced at one end of the coax, it can be sensed , the opposite direction, by the sampling line- basis for an SWR bridge-- Also works at microwave, with slot in waveguide to another attached waveguide section- one end sealed (these are indeed called a "directional coupler") Jim NN7K

That would be right hand horizontal and left hand horizontal, actually.

Sorry, couldn't resist.

Should be about .43 meters per SSB electronics. I have also read .8
wavelengths, so roughly .56 meters in that case. Personally I would go
with the larger of the two.

I've voulenteered to help the SDSU mechanical engineering studens get
telemetry from their rocket see:
http://www-rohan.sdsu.edu/~sharring/sdsurocket.html.

I have all the electronics working, I'm using a commercial 910Mhz
telemetry radio, I have every thing working except the antenna.

For the last launch I burred a dipole in the plywood fin, alas
the rocket did not launch it caught fire and burned up the fins.
(It did not burn as far as the electronics.)

The new fins are carbon fiber composite so no antenna there...

The rocket will get to mach 2 so small wires sticking out will
probably break or burn up.

I have enough power and ground side gain that I need no gain
from the rocket, an isotropic radiator with 3db of loss would be fine.

Any suggestions?

My ideas and thoughts:

1)Simple 1/4 wave vertical sticking out the bottom plate of the rocket
near the engine.

Pros:
simple.
Cons:
lots of metal to block the signal and mess up the pattern.
Not clear if the ionized exhaust will block the signal.
Antenna pattern is almost exactly wrong.

(Telemetry really needed for recovery tracking so ionization fading is
not a deal killer)

2)Horizontal dipole at the bottom plate of engine.
All the problems of #1 except pattern.

3)Put Fiberglass windows in the electronics bay near the nose of the
rocket. One window on each side, Driving two hosrizontal dipoles with
a power splitter, one dipole on each side.

Pros: Easy to do.
Cons:
I don't know what the pattern would be like, or exactly how I shoudl
phase the two antennas on opposite sides. (Some metal between then so
not a clean situation.)

Resources:
It have a minicircuits SMA 2 way power splitter, and can make precise metal parts (0.002" or better).
I do not have any antenna testing equipment that is any good at 900Mhz.
so any suggestions...

Paul (Kl7JG)

Or would be better to use a center fed inverted V with its low
impedance that can be mathed with smaller losses to 50 Ohms?

Pass go and collect $200.... Way better than any other
method...Scrap the tuner...Thats the last thing you want
for QRP...Center feed with coax...Can be lightweight rg-58...
You really don't even need a balun...In the unlikely event rf
at the rig is a problem, just roll a few turns of coax at the feed,
and tie wrap it...As a bonus, you can add wire, or insulators,
and use for other bands, or make it multiband, with insulators,
and jumpers to change bands...No tuner needed anywhere,
once it's set up. You could make one for all bands...
Would look kinda like this for a 20-40-80m version.....
-----------------o---------o-------00--------o----------o-----------------
You jumper all the insulators for 80..Only the inner ones for 40,
and none for 20...In that pix, you can't see the jumpers.....
Can be wires with gator clips, or whatever....I've used that
portable many times...Usually built on site from wire and stuff
I carry...But I usually just make them for 80/40....

Wonder if the rocket body is tall enough to tape thin wires
to the sides for a dipole, or 1/4 wave... IE: a dipole for 910
mhz would be about 6.1 inches or so...3.05 inches per
leg of the dipole, if center fed...Seems you could wrap the
thin 3 inch legs around the rocket body, and make a "circle"
dipole of sorts...You could stagger the ends, so they aren't close
together, or you could even run it vertical...Magnet wire would
be ok, if you could get some strong tape, glue, epoxy, silicone,
etc, to stick it to the body...The "bump" on the body wouldn't be
that drastic I don't think, but you'd have to talk to your rocket guys
about that....MK

Good Lord, forget the power splitter and all the rest of that stuff. Find a place on the rocket that you can have a simple copper foil dipole fed with a coax "split tube balun". You need more info on how to do that? Just post here and I'll do what I can.

Your question is interesting, mach II, wow!
I found this page, it deals with models constructed of carbon fiber--and
their worries about it affecting antenna/signals:
http://www.rcuniverse.com/forum/carbon_fibre_and_antenna/m_2747045/tm.htm
A guy or two there have claimed to have done some tests, how relevant these
are to you, you will have to discern....
If their claims are correct, and operation of an antenna around, under or
near carbon fiber is possible--how about copper foil tape on the fins--under
a gelcoat??? Just an idea....

Warmest regards,
John

I would suggest a simple thin wire dipole super glued or gel coated onto
the fins , Carbon fibre normally wont provide much signal reduction and
the radiation pattern should be acceptable .

> Thanks Dave
I don't know if my stacked big wheels on 2 are any guide, but here is my
layout.

The 4 Antennas are spaced 48" apart. The 50 ohm coax goes to a center
mounted point.
Two coaxes come from the center point, the first to the center of the bottom
pair. The second
to the center of the top pair. Each antenna is fed from the centerpoint of
its pair.
My big wheels seem to have a very broad bandwidth, with low swr across all
of 2 meters.

Thus 16 inches sounds about right.
Regards,
Ed, N5EI

I'm surpised no one has asked how much transmit power is available, and how high the rocket is expected to fly.

Regardless, unless a micropower transmitter is being used, it seems to me that a very simple quarter wave nose tip made if 1/8" rod or similar material would only protrude a few inches above the nose and would probably do the job. At this frequency, even a tiny metal mass inside the nose would probably be a sufficiently good counterpoise for feeding it.

This seems like a simple problem (or 'no problem'). I'm surprised at the complex solutions.

It may be just the few of us.
My father directed artillery fire from a spotter plane with a key on a leg strap.
Therefore I learned the code and the alphabet simultaneously.

I recall an article in Electronics World from 1962 referring to the genesis of CB:

"The electronics industry needed a shot-in-the-arm." IIRC

The rule-makers "stabbed themselves in the back with their own ballpoints."
I will never forget that phrase; no "IIRC" needed.

I am still laughing.

H. Adam Smith wrote:
"I recall an article in Electronics World from 1962 referring to the
genisis of CB:
"The electronics industry needed a shot-in-the-arm"IIRC."

It didn`t last. Now the magazine is gone too.

Ordinary citizens were denied access to the airwaves at the time. The airwaves are public property which they could be permitted to use. The airwaves are public property as the air we breathe is public. CB allowed the general public legal access with no technical or Morse mumbo jumbo.

Profit potential gained support from many who would not have been for loosing control over radio.

Best regards, Richard Harrison, KB5WZI

Ok. I had to go out this morning.
I stopped by a used book store, I found two circuits, using the toroid in a similar fashion to what I am working with.
What I found is "THE 1989 EDITION 'ARRL HANDBOOK'." ($2 bucks, what a buy, huh?)

On pgs. 34-9 and 34-10 the similar circuits exist, I have placed them at:
http://blake.prohosting.com/mailguy2/swr1.jpg
and
http://blake.prohosting.com/mailguy2/swr2.jpg

This should prove as "proof of concept" that an "indicator" using such a toroid should darn well work! ... at the very least--in the fashion I am attempting...

swr1 is claimed to handle up to 150 watts, swr2 2KW!

So, now we should all be on the "same page" and, even those "high priests" of ARRL should NOT be offended!!!!

If anyone is greatly interested in the text of construction details/article--email me....

Warmest regards,
John

Doesn't his original post "indicate" he wishes a "horizontal" polarized ant,
as opposed to vertical nose rod?

At least, that is why I dismissed the "obivious."

Warmest regards,
John

I forgot to include the part of his original post which suggested this to me, here it is:

"Antenna pattern is almost exactly wrong."

...when he was referring to a vertical antenna hanging from the tail (probably melt in the exhaust!)

Warmest regards,
John

If you will notice, your earlier versions did not sample
the voltage. These designs sample the voltage through C1
and C2. The current is sampled by T1. The voltages are
phasor-added to the current to obtain signals proportional
to forward power and reflected power. Those voltage sampling
caps are what were missing from your earlier designs.

Is it just me, or does "Mach II" suggest paint blistering speeds and plastic melting frictions with air???

And, is that aluminum I see that rocket body made out of? Or, not?

The carbon fiber just might absorb enough heat to keep a high temp coating from burning off copper foil... if the flight is of limited duration...

Am I missing something or imagining "problems?"

Warmest regards,
John

<Paul@Rasdoc.com> wrote in message

| I've voulenteered to help the SDSU mechanical engineering studens get
| telemetry from their rocket see:
| http://www-rohan.sdsu.edu/~sharring/sdsurocket.html.
|
| I have all the electronics working, I'm using a commercial 910Mhz
| telemetry radio, I have every thing working except the antenna.
|
| For the last launch I burred a dipole in the plywood fin, alas
| the rocket did not launch it caught fire and burned up the fins.
| (It did not burn as far as the electronics.)
|
| The new fins are carbon fiber composite so no antenna there...
|
| The rocket will get to mach 2 so small wires sticking out will
| probably break or burn up.
|
|
| I have enough power and ground side gain that I need no gain
| from the rocket, an isotropic radiator with 3db of loss would be fine.
|
|
| Any suggestions?
|
|
| My ideas and thoughts:
|
| 1)Simple 1/4 wave vertical sticking out the bottom plate of the rocket
| near the engine.
|
| Pros:
| simple.

| Cons:
| lots of metal to block the signal and mess up the pattern.
| Not clear if the ionized exhaust will block the signal.
| Antenna pattern is almost exactly wrong.
|
| (Telemetry really needed for recovery tracking so ionization fading is
| not a deal killer)
|
|
| 2)Horizontal dipole at the bottom plate of engine.
| All the problems of #1 except pattern.
|
|
|
|
| 3)Put Fiberglass windows in the electronics bay near the nose of the
| rocket. One window on each side, Driving two hosrizontal dipoles with
| a power splitter, one dipole on each side.
|
| Pros: Easy to do.
| Cons:
| I don't know what the pattern would be like, or exactly how I shoudl
| phase the two antennas on opposite sides. (Some metal between then so
| not a clean situation.)
|
| Resources:
| It have a minicircuits SMA 2 way power splitter, and can make precise
| metal parts (0.002" or better).
| I do not have any antenna testing equipment that is any good at
| 900Mhz.
| so any suggestions...

I define true "isotropic" as impossible... perhaps a sphere as an antenna--in space...

I define "3db of loss" as the "minimum acceptable", not the desired...

Got anymore hairs to split, I got my "hair-splitter" out, no problem really...

Regards,
John

Yes, I suspect that mine is relying on "stray capacatance" and it is not sufficient--and--that is why I experience that "plunge into darkness" of the REF LED at 1:1--and NOT a smooth adjustment and indication... (just guessing)

Anyway, those capacitors are VERY small ~3pf, and as Cecil was so kind to point out to me, in an email, a twisted pair of high-pot enameled wires would, most likely, suffice--keeping with my "cheap and simple" design.... I can simply chuck another of my junkbox toroids in for the rf choke...

Warmest regards,
John

Fred has the right idea given the construction materials, and the need
for obstruction-free (much less friction-free) elements.

However, no one has actually responded to your concern about pattern.

With you or your trackers occupying the area directly below the rising
rocket, this places you in the null of a vertically polarized antenna
of conventional length. However, if you lengthen the radiator to
several wavelengths, this will produce radiation lobes that reach down
toward ground control, rather than out towards the horizon (where you
are not).

In some countries we have codified into legislation the limits of freedom of speach. You can't yell "Fire" in a crowded theatre. You cannot incite an individual or mob to violence. You may not speak treasonously. You cannot speak in such a manner as to instill fear in another. You cannot incite hatred of another on the basis of their race, religion, gender, culture and other such affiliations.

NB speak includes acts such as displaying symbols.

In Australia, we do have the right to burn the Australian Flag in protest. We have the right to speak out against unjust laws.

In addition we have a Legal Tradition of extensive freedom of religion and other matters not codified because they are not the concern of the State. Australia is a secular nation, has been religiously plural since the invasion by the Brittish in 1788 (Catholics were allowed to worship freely, convict and free man alike).

...Brock.

Phoenix, Standard and other missiles use rear data link antennas
buried behind the rocket plume without trouble. Of course these are
at X-band, not 900 MHz, and receive only with *really* high powered
transmitters.

Well, the fact that you don't have any test equipment is a real
downer.

The best suggestion, although I think time is an issue for you, would
be to go to a commercial vendor and beg for a "contribution". My
former employer (Hughes) gave money, time and materials to various
universities all of the time.

The elegant solution would be a conformal patch but I imagine this is
beyond your resources.

http://www.uaf.edu/asgp/asrp/srp4/srp4_parts/electrical/patchantennas.htm

It doesn't look like there is any roll stabilization so you might need
some pseudo "omni" pattern, during flight. But if you are only
looking for TM after burnout and during the return to Earth (I assume
dangling on a parachute) then you will know the attitude (at least
"up" and "down"). Personally, I think that flight dynamics data
during the powered phase would be more interesting to engineering
students. [g].

Fiberglass window(s) with dipole(s) behind them would probably work
okay. Two with equal power split would be fine, however, one might do
okay too.

Regardless, it sounds like a fun project. Have fun.

Well, there ya go, see...
We Americans just can't even bend our minds there... indeed, if ever our gov't becomes oppressive and unheeding to the people--we are called, NO we are DEMANDED, to rise up and over-throw such a gov't...
Most find that just impossible to understand... a gov't of public servants elected, appointed and hired to conduct the citizens business...

However, I know some of our public servants, indeed Mr. Bush might be sited as an example of this by some, are tending to mislead how the rest of the world perceives this to be.... someday soon, we may have to do something about that...

Hey, but that "theatre part" you site in your example--here in America we just call that "common sense" and go about our business...

Warmest regards,
John

Roger:

Isn't that a "resistive bridge" and consumes ~3/4 of the power? Or, am I looking at the right design?

It just occured to me, because of your post, I didn't say "can be left inline" for my design criteria--sorry, my mistake....

But, yes, that would be good enough, thanks for pointing that circuit out to me.... my only problem, is other than a walkie-talkie, I have no rf souce of that low of power (~4 watts or less)....

Warmest regards,
John

Ok Ed sounds like you antennas are feed with a phasing harness . Here is where I saw this type of antenna setup advertised using a Power Splitter using equal length of cable, I thought this would be simpler But this article said some thing about phasing the antenna and naturally the author of this add is not going to tell you much. http://www.hamtv.com/wheel.html

Source record: 77576

The having no port is the main problem...That means you
have to use those coupler devices that fit behind the antenna
in the phone...Unfortunately, I just had to buy a new phone,
and my new one is the same way. No port...They make a sleeve
that fits over the top, and has a patch to couple to the internal
antenna, but I have to wonder how well it works...Some reports
seem lackluster...As far as antennas, I guess it depends on
what you want...A connection to a cheap UHF TV antenna
might work ok....But most long distance house cell antennas
are yagi's that I see sold. Anything commonly used for UHF,
could be adapted to cell phone...Often on those freq's, just
moving a few feet can make a big difference...So I'd try different
locations, and try to find "hot spots"...Thats about where I would
mount the antenna if it's not going to be real high...
I'd like to find the goofball that decided these phones don't
need an antenna port....:(Whatta putz....Having an outside
antenna makes a huge difference out on the interstates... MK

Interesting. I seem to remember that one of the earlier (ARRL?) handbooks
had an
article on big wheels and how to adjust the phasing. My antenna is from the
70's and I
recently replaced all its coax. It was the Cuschcraft model and not as well
done as I would like.
It does work though.

Perhaps one of the old timer antenna experts would have a reference for the
phasing information.
Or could you simulate it with NEC?
Regards,
Ed, N5EI

Yes it seems to be best suited for a quick antenna check before turning up
the juice!
Sorry it doesn't meet your needs.

" no technical or Morse mumbo jumbo"

That's the problem Richard, it isn't mumbo jumbo, but what happened on 11 meters usually sounds like mumbo jumbo.

How shall I compare thee to a blighted operation?

Let me count the ways:

1. It won't work.

Need I say why? (Hint: review all my other postings that describe
exactly why.) This example is yet another in a long list of
repetition in the vain hope of a different outcome.

When the radio amateur service was established, spark transmitters abounded.. Transmitters lacked stability, movies were silent, and ionospheric propagation was not well understood.

A lot has changed. Radios are very stable and radio-telephone has long been the mode of choice. An operator specially trained in the theory and practice of radio is no more necessary than a trained auto mechanic is needed to operate a car or truck.

Operators should know radio law and rules. They should be required to operate within the law. When they break the rules they should be penalized.

Best regards, Richard Harrison, KB5WZI

All the kidding is in the choke which guarantees no LED will ever
light. Below KW levels that is (you seem to miss this key clue every
time) and not even then unless the whole rig arcs over.

I wouldn't count on a constant current device then either (another key
clue that is wholly ignored).

Thanks for all the fine suggestions.
Some general comments and answers to questions...:

1)The body of the rocket is Aluminum.

2)The receiving station is right next to the rocket so as it launches it will be going directly away from the telemetry transmitter.

3)The nose cone is out as it detaches and comes down via seperate parachute at the time of recovery.

4)No roll control system so the rocket will be expected to spin slowly.

5)1W of output power.

It looks like a cu tape dipole on the fin with some glass over the top might be best solution, it seems no one but me is worried about the carbon fiber.

So using 1/4" cu Tape glued to carbon fiber ,how long should it be and should the ends be round, square or pointed? (910 Mhz)

The rocket has three fins 120 degrees apart, could I put an antenna on two fins and get quasi circular polarization?
If so how should I drive the two antennas?
(I'm not an antenna guy so please try and be specific, ie use a 21.5cm peice of Rg-XX)

I have no portable antenna test quipment for 910Mhz, but I can carry the resulant antenna into a friends work and use a 2Ghz spectrum analizer with a tracking generator if that would be useful to test antennas.

If I have just one fin antenna how can I build a circularly polarized antenna for the ground side?
(I presently have a 8dbd loop yagi for the receiver, H or V polarization, not ciurcular..)

Well, I just a new experimenter with antennas--in the past have only played with "tried and true" designs....

However, I can't help but see that three cu foil horizontal "monopoles" worked off an aluminum body of the rocket does present itself to the mind...

Cecil is a good modeler with EZNEC, I am hoping he will find this interesting enough to comment... and of course the OM Roy is acknowledged top expert!

If three monopoles, each fed off a quarter matching section of thin coax, and worked off the counterpoise of the aluminum rocket body "counterpoise", would present a load of say ~11 ohms (or, does it work that way? or, would that present a load of ~36 ohms?), then a 4:1 UnUn could be used, "backwards", to present a 44 ohm to the xmitter--50/44 = negligible SWR... one monopole on each fin....

While NOT circular--maybe close enough to provide acceptable signal strength...

If this is plausible, a formula for cutting a 1/4 wave as SHF, and cut a bit longer, then trimmed to resonance by coupling to a GDO capable of 900+ Mhz....

But, you are probably too close to launch time for extensive experimentation... or, are some of those students' hams to assist?

But then, my mom always said I read too much "science fiction."

Maybe these other guys will apply their knowledge here and both you and I will pick up some points...

On a side note, two crossed dipoles make a turnstile antenna, this is a circular polarized antenna... but crossing two of those fins is impossible... maybe the dipoles can be separated by some distance and still work... here I can only wonder... indeed, if you choose this, would be a shame to leave that third fin out there, naked... <grin>

Whatever, GOOD LUCK!!!

Warmest regards,

John

<snip>

Yep. The example itself was first (as I recall) cited by Oliver Wendell Holmes, Sr.:

"But the character of every act depends upon the circumstances in which it is done. Aikens v. Wisconsin, 195 U.S. 194, 205, 206. The most stringent protection of free speech would not protect a man in falsely shouting fire in a theatre and causing a panic. It does not even protect a man from an injunction against uttering words that may have all the effect of force. Gompers v. Bucks Stove & Range Co., 221 U.S. 418, 439. The question in every case is whether the words used are used in such circumstances and are of such a nature as to create a clear and present danger that they will bring about the substantive evils that Congress has a right to prevent." -- Oliver Wendell Holmes, Sr., Schenck v. United States, 249 U.S. 47 (1919)

Of course, that case was about a man distributing flyers to protest the draft in WWI...

Yours wolfishly,

The quote-citing,

Wanderer
wanderer@ticnet.com

"Where am I going? I don't quite know.
What does it matter *where* people go?
Down to the woods where the bluebells grow!
Anywhere! Anywhere! *I* don't know!"

SWR is not a concern. You may be interested to know that 17:1 SWR was pretty common in many of the satellite antennas.

As they are interested in signals as the rocket is going away, an end fed "longwire" would do just fine.

Were it my project, I would use 4 slotted antennas cut at 45 degrees to the axis of flight. Particularly because the rocket is not spin stabilized. While Mach 2 was mentioned, I suspect it would exist for a very short time. Standard Plexiglas would most likely serve well as a slot cover.

I am just out of my field here (never stopped my comments yet <grin>) but, symmetry seems to be the key here

Others are often having greater luck than me; however, I have great respect for Mr. Murphys law.

If I were to hang a long wire (even at near Ghz freqs.) off a single fin, having constructed it from wire hefty enough to take mach speeds with ease, I would worry about drag.

While that long-wire may not end up taking on the weight of an elephant, I would take it for granted it could be measured in ounces, indeed, I expect pounds are quite possible

This does not suggest itself favorable to straight as an arrow flight

Warmest regards,

John

Cecil is right. Also, the 100K implies 200V to get 2ma of LED current. The
1N914 won't hack that.

I didn't say that. I'm not a composites man, but it seems to me that "carbon fiber" is a pretty broad catagory, with potentially a wide range of dielectric properties. When you attach your radiator, of whatever kind, to a dielectric substrate the electrical properties are going to be affected to some degree.

If by experiment (something you are without the means to do) you find the proper length for your dipole, then when you encapuslate it in glass fiber, you have added a second dielectric.

And then... how do you attach the transmission line? I presume that the line will be inside a hollow fin but you have to make a connection to a foil that, until it is covered with the overlay, is on the outside of the fin. Even if you succeed in the attachment, at Mach 2 this is not a benign enviroment. I suspect a lot of vibration. A soldered connection might fail. In industry, we would shake the hell out of the thing to see what happens.

As you've seen, being "specific" isn't going to happen. I think you
have enough trouble without trying to achieve circular polarization,
something that doesn't seem to be a requirement anyway.

>
>I have no portable antenna test quipment for 910Mhz, but I can carry

No help unless you can use a reflection bridge, driven by the
generator and sampled by the SA. Otherwise, these are useful for
insertion measurements only.

>If I have just one fin antenna how can I build a circularly polarized
>antenna for the ground side?

The axial-mode helix would normally seem to be the antenna of choice.
They are forgiving designs and of reasonable size at 900 MHz. Do not
expect the gain that is rumored by Kraus. However, one expects that
the missile goes "downrange" so if you want recovery data down to the
ground then you might need some tracking using a gain antenna.

An option might be a turnstile over a groundplane that can give
circular polarization and a nearly omni pattern down to the horizon.
But if you achieve the 100 mile altitude and depending on when the
parachute is deployed and winds aloft, "downrange" might be quite a
distance. You need to do some link budget calculations for this.

The frequencies between the 10 meter ham band and CB are a target rich
environment.

Yes. I frequently find I overtax a components max. ratings (the smell of burnt electronics is an acquired taste, like tobacco smoke and beer <grin>)... I tend to pick up large quantities at auctions and surplus outlets... replacing "sane design methods" with brute force and the wholesale slaughter of un-counted components...

And, one should use caution with my labeling of components--I have boxes of silicone diodes which are "similar" to 1n914's--and pounds of mis-valued resistors/caps (the manufacturers just don't realize the value of a resistor marked as one-ohm--when the actual value is one meg-ohm!!!)

"Whatever works!" sometimes becomes, "A list of what doesn't work!"

Quite often, the answer lies in "what I haven't tried..."

I don't expect all to be able to appreciate my "methods"... but, it breaks the monotony of having to be so precise--which my field places upon me...

Warmest regards,

John

Well, let's just kick back and relax--after all-we are not dealing with
"Rocket Scientists" here....

OHH! Wait a minute--WE ARE!!!! <grin>

Warmest regards,
John

<Paul@Rasdoc.com> wrote in message
news:f6sl71huakqprgoediteeb3fj4atr19kk2@4ax.com...
| I've voulenteered to help the SDSU mechanical engineering studens get
| telemetry from their rocket see:
| http://www-rohan.sdsu.edu/~sharring/sdsurocket.html.
|
| I have all the electronics working, I'm using a commercial 910Mhz
| telemetry radio, I have every thing working except the antenna.
|
| For the last launch I burred a dipole in the plywood fin, alas
| the rocket did not launch it caught fire and burned up the fins.
| (It did not burn as far as the electronics.)
|
| The new fins are carbon fiber composite so no antenna there...
|
| The rocket will get to mach 2 so small wires sticking out will
| probably break or burn up.
|
|
| I have enough power and ground side gain that I need no gain
| from the rocket, an isotropic radiator with 3db of loss would be fine.
|
|
| Any suggestions?
|
|
| My ideas and thoughts:
|
| 1)Simple 1/4 wave vertical sticking out the bottom plate of the rocket
| near the engine.
|
| Pros:
| simple.
| Cons:
| lots of metal to block the signal and mess up the pattern.
| Not clear if the ionized exhaust will block the signal.
| Antenna pattern is almost exactly wrong.

| (Telemetry really needed for recovery tracking so ionization fading is
| not a deal killer)
|
| 2)Horizontal dipole at the bottom plate of engine.
| All the problems of #1 except pattern.
|
| 3)Put Fiberglass windows in the electronics bay near the nose of the
| rocket. One window on each side, Driving two hosrizontal dipoles with
| a power splitter, one dipole on each side.
|
| Pros: Easy to do.
| Cons:
| I don't know what the pattern would be like, or exactly how I shoudl
| phase the two antennas on opposite sides. (Some metal between then so
| not a clean situation.)
|
| Resources:
| It have a minicircuits SMA 2 way power splitter, and can make precise
| metal parts (0.002" or better).
| I do not have any antenna testing equipment that is any good at
| 900Mhz.
| so any suggestions...

Paul:

If you don't mind, I would have a question for you (or, if you would be so kind as to pose it to a college there)--one I have always pondered...

Take your rocket there, if its top speed is mach II--why not--say at mach-one, release the fins in a simultaneous-organized-precise manner--ridding the rocket of the leading fin edge drag--and hopefully--allowing it to reach a greater max speed/altitude...

Wouldn't the "steering" of the air drag on the sides of the body provide enough "control" at such speeds or, even sub-mach speeds--possibly?

Of course, if that antenna is there... <grin>

Warmest regards,

John

While there's nothing wrong with this kind of approach when you're making one of something for your own use, the resulting design isn't likely to be useful to others because of the slim chance of someone else being able to make a copy work.

2241. Making aluminum tubes telescope smoothly, with good electrical conductivity?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-07 20:54:03 UTC
From: tf3kx@simnet.is
Message-ID: <1115499243.168134.264810@g14g2000cwa.googlegroups.com>
Source record: 77606

Hi:

I am working on an extensible vertical consisting of a 6m/18ft outer aluminum tube (40mm/1.5" diameter) and an inner aluminum tube that can be extended out of it with a motor mechanism. For certain reasons the inner tube has to be substantially slimmer than the outer one, probably around 25mm/1" diameter. So, to make a reasonably tight fit I will make a narrowing "collar" at the top of the outer tube, where the inner one will emerge upwards. Furthermore, at the bottom of the inner tube I will fasten a cylinder that almost fills the outer tube, providing mechanical stability there. Sort of like a piston inside the outer tube. Thus, the mechanical connections or interfaces between the outer tube and the inner tube are at the top of the outer tube and at the bottom of the inner tube. At these key points I need to ensure:

a) Good electrical contact (so that antenna currents can continue from the outer tube to the extended inner tube;

b) Minimal mechanical friction as the inner tube is pushed up and retracted back down.

Are there any suggestions on this? What metal should I use that slides with low friction against the aluminum tube wall, does not corrode at the contact and provides good conductivity?

Source record: 77607

Basically, either antenna can be fine. Just try to make sure that the section that carries maximum current (and thus does most of the radiation) is as high and clear of conducting objects as possible. Also, avoid bending that part of the antenna much more than 90 degrees. For example, if you make a 180 degree bend, radiation due to currents going in opposite directions will largely cancel out.

For your half wave long wire the place of maximum radiation is at the wire center, and then tapering off towards the ends. So, keep the center of that antenna relatively straight and high up. Don't let strict theoretical assumptions hold you back from trying out what one might think is impossible. For example, I have frequently made QSOs for over 4000 miles with 1W (one watt) and a horizontal half wave wire only 8-10 ft above ground on the 20m band. And that at the poorer half of the solar cycle.

I suggest you keep your end fed half wave wire and use a small tuner with it, such as the ZM-2 (http://emtech.steadynet.com/), and feed the antenna wire directly from the tuner (no coax). It is very small, versatile and has built-in an SWR indicator. It takes power up to approx. 15W and has so far tuned into just about anything for me.

73 - Kris, TF3KX

2243. What tool to measure SWR at 910 Mhz?

i was wondering.. ... currently i have a horz center fed dipole it's not big but my roofside sgc at least keeps the swr's nice.

it's about 20ft off the surface of my roof wich is about 175ft off the ground ...

i was thinking about adding a verticle antenna such as the challanger(gap) or such...

what i ponder is what if any improvements i might see over the dipole or if under what 'conditions' it might be better --if at all??

tnx

How big should this cardboard be? I might try this. I bought some
cheap tv antenna rabbit ears and got a minimum signal to check
messsages in my basement. What actually is the antenna inside my cell
phone anyway? I just need a larger version of that maybe?

Hi Myles,

Probably none, or at best, different from the dipole, but only on
alternate days (as an average, no difference).

You might try using "NoAlox" or "Penetrox" - or some other namebrand compound between the tubes. It contains particles for 'cutting-through' the aluminum oxide insulating film that would normally form - and - would inhibit the oxidation of the aluminum. Its also a grease - encourages smooth action. (put your gloves on.)
available at in the electrical depts at home centers like lowes - or at electrical supply companies.

One thing to keep in mind is a horizontal antenna by nature is more quiet antenna and is going to be someone directional. A vertial is going to be omio direction and prolly better at working DX because it's angle of radiation is going to be lower.

Source record: 77620

Years ago I built a hand operated telescoping vertical.

No HF current inside the tubes therefore no need for electrical contact at the bottom of the inner tube: a plastic sleeve/ring is ok, adjust shape and size for mechanical stability and limited friction, water is a good lubricant for plastic...so let rain enter the bottom tube... and drain off .

A good, low friction and corrosion resistant contact at top of the outer tube can be made of pieces of graphite (like electric motor brushes) pressed by stainless springs. You don't need to have a 360° contact, 4 pieces equally spaced would be OK.

If you use regular commercial aluminum you can't avoid corrosion as friction when moving the tubes will remove any surface protective treatment. You need a special "professional" alloy: check with a specialist. This is specially critical for the bottom tube as you cannot clean the inside.

Also check that your bottom tube is an "extruded" tube with a perfectly smooth internal surface without ridge.

Hope that can help, 73

Message-ID: <m-C1DA69.07302708052005@news.verizon.net>
Source record: 77621

hi

. ... currently i have a horz center fed dipole it's
about 25ft on the hot side and about 40ft on the rf gnd side. It's a
center fed, via about 5ft of 450ladder into a sgc237 at bottom of
fiberglass mast.

the sgc does a great job of tuning all the bands my swr are almost
always great.

but i was wondering if i were to add some extra length to it , if my
performance would signifantly improve?

the only way i could do it would be to add length starting at the end
support masts, going verticlly down to the roof 'floor' and then
following the roof edge.

most i could prob add would be about 30ft on the rf hot side and maybe
20ft on the rf-gnd side

altogether it's about 20ft off the surface of my roof wich is about
175ft off the
ground ...

anyone think this would give me some significant improvements?? ie is
it worth it?

thanks

Here's some comparison radiation patterns on 40m for the
horizontal and vertical antennas that I had up a year ago.
The vertical suffered from 2 S-units higher (local) noise.

Something like might work at a preset QRP level if you
can get enough turns on the toroid. What is the reverse
voltage rating on the LEDs? How about connecting coax
ground and logic ground on the schematic so Kirchhoff
will be happy?

You want a metal corner between squares, 1 or 2 feet on a side. It makes a reflector in which images align with the cell phone antenna.

The problem with the Bird is that it requires considerable power to
run it. With 1 watt available, you're (the OP) kind of out of luck.

The OP has access to a spectrum analyzer/tracking generator. I
suggest a directional coupler with the main arm driven by the
generator, the coupled arm as the input to the SA and the thru port to
the DUT. Calibrate the SA with a short on the output of the coupler
(100% reflection) and measure return loss directly in dB on the
screen.

A similar idea using diode detection is here:

http://www.qsl.net/n9zia/24swr/

A Wattmeter is probably the easiest to use at 910. Slugs for the
standard Bird Wattmeter can be bought to cover that range. At work, I
use a Telewave Wattmeter. It goes from 20 to 1000 MHz with no slugs.
The model 44A is probably the best bang for the buck (in my opinion).

http://www.telewave.com/pricelist/wattmeter.html

For the Bird (4410A Wattmeter):
http://www.bird-electronic.com/products/product.aspx?id=333

Bird does have a 1-watt measuring element, part 800-1, for 800-950 Mhz
-- there's also a 2.5 watts element, the 800-2.

Still, this is all may a bit pricey, about $4-500 for the meter and
one element -- maybe he can borrow?

First you need a radio capable of 'full-duplex'(capable of hearing the downlink while transmitting on the uplink), other wise you'll just add to the qrm.

Second is a good gain antenna for both uplink and downlink frequencies. The 'hand held' arrow antenna with diplexer is pretty good (www.arrowantenna.com) or you can make your own. (there are plans on the internet try http://xe1mex.gq.nu/antenas/yagi.html to start). [avoid the ELK antennas]

Third is to make at least a dozen QSO's over the satellite you plan to use BEFORE field day. Conditions of field day are very rough and inexpienced operators don't have a chance.

Go to the AMSAT web page www.amsat.org and look around for more tips.

I stand corrected. I just checked the RF Parts link and didn't see
any.

Thanks for all of the replies.
I just ordered a used Bird 43 and an 801-1 1W 800->1000Mhz element.
from radiodan.

Also, any of the Bird lookalikes (Struthers, Dielectric, STB,
General Signal, ect.) These are almost duplicates of the Bird 43
even use the same slugs, and their slugs will work in Bird meters)
Also, Struthers, ect. made meters that have 4 power range slugs
(good to 500 watts, and 1000 MHz) Telwave (no slugs required, has
4 range power switch, looks otherwise a lot like the #43) is good
to 1000 MHz. Can find them on E-BAY, under
"Watt Meters". As info, Jim NN7K

Uh-oh!! You're in trouble now. As a recovering Bird addict, I must warn you that YOU CAN'T OWN JUST ONE BIRD SLUG.

You ordered a 1-watt 800-1,000 Mhz element and you think you're safe. No way. You will notice that the Bird carrying case has room for several slugs, so why not fill it up? So, you'll figure, oh, what the hell, I really need a 1KW HF slug. Then comes a 1-watt HF slug. Then maybe you'll need a 100-watt VHF slug. And from that point on, it's all downhill into the dark night of addiction.

Then your wife says, "Why do you need all these?" And you say something like, "Well, I have half as many slugs as you have shoes so what's the problem."

Get help, quick!!!

I know.

:-)

Message-ID: <oltfe.105$ce6.43@newssvr30.news.prodigy.com>
Source record: 77541

I had a dipole and vertical when I lived in the Four Corners and the vertical was so noisy on receive that it was just about useless but I did use it on transmit. Farmington is at 5600 ft. elev. and quite dry with dry rock soil.

Later when I moved to Tulsa where the ground and air are always damp the vertical was a lot quieter and useable on receive.

Radials do make a noteable differnce, the more radials the better but no on receive. Lots of noise is vertically polarized and drier air seems to have more.

Source record: 77542

On 40 meters, I have a vertical with two sloping radials with the top of the vertical at 60 feet. I also have a full wave center-fed horizontal antenna that I use on 40, and that antenna is at 65 feet.

90% of the time, DX stations are stronger and/or more readable on the vertical than on the horizontal antenna. Likewise, 90% of the time USA stations east of the Mississippi (I'm in NC) are much stronger on the horizontal than on the vertical. However, there are those occasional days when many stations in the eastern USA are stronger on the vertical than the horizontal.

If I'm working a USA contest or just want to participate in ECARs, MidCARS, or SouthCARS, I'll go with the horizontal. DX chasing is always done on the vertical. I can switch between the two for those rare exceptions.

I'm in a pretty quiet area from a noise standpoint, and find no advantage to either antenna when it comes to noise.

If you have no interest in DXing, I'd say just stick with the horizontal antenna. If the prime interest is DXing, then the vertical might be the way to go for you. An interesting variation that provides decent vertical and horizontal polarization is the center fed "L", where one half is horizontal and one is vertical, fed at the center with open wire line. That works remarkably well for me on 80/75 meters.

Just out of curiosity, did you have an RF choke or resistor across the vertical's feedpoint to bleed off static when you lived in Farmington?

EZNEC will show you what the tuner sees but more importantly,
will give you the radiation patterns for your antenna and any
change you choose to make.

Hi Brett,

Well, it is difficult to compliment one for losing the race. In the
Navy we had a saying about "attaboys." It took 1000 of them to get a
"job well done" and one "awshit" to erase all the attaboys you had.

Now for the attaboy, it's nice to see that you have finally divorced
the extra diodes.

Another attaboy, it's nice to see that you divorced the common cathode
path.

So enough patronizing and back to reality.

What are the capacitors for? If R is too large, then they will shut
off the diodes (this is called a clamp circuit for very good reason).
If the R is too small, you won't see the flicker anyway.

What are the extra resistors/constant current devices for? The
constant current device bridged by a smaller resistor (I must presume
they are the standard 50 Ohmers) is self defeating.

And what is with the connection between the inner line, coil middle,
and common for?

I note you reserve the rights, to what? a self extinguishing Power
indicator?

Yeah, you guessed it: awshit at least once if not three times (poor
form when they outnumber the attaboys).

Hi Brett,

Little Harm? It has been quite evident that electronics is quite new
to you (contrary to whatever experience you may feel you have
accumulated). Putting a capacitor at the output of a rectifier
doubles the reverse voltage stress that the rectifier has to tolerate.
If you are worried about FETs (like cutting out cholesterol for the
sake of your appendix), then your lacking equal fear for the LEDs'
breakdown is a bit strange.

Anyway, I doubt you have actually worked through the analysis given
all the gauche designs that lead to this. It is presumed that the RF
will be "spike" free (the FCC frowns on such spurious content); or
that if you are simply speaking about HF in general, then it follows
that you could have simply dumped the RF to ground by shorting the
Caps in the first place (no need for the useless FETs either).

>I threw the second fet in because I felt guilty about having too few
>parts!!! <innocent-look-with-fingers-tightly-crossed-behind-the-back>

Uh-huh. As I said, Mad Man Muntz would have a field day.

2286. FS: Diamond Dual Band base antenna X510M (used in good condition) $125.00

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-09 00:08:34 UTC
From: Aspen37 <pottsladd13@nospam.yahoo.com>
Message-ID: <6Sxfe.193776$cg1.42912@bgtnsc04-news.ops.worldnet.att.net>
Source record: 77551
Cross-posted to: alt.ham-radio.vhf-uhf,rec.radio.amateur.antenna,rec.radio.swap

The Diamond X510NA was designed for strength and performance and is
pre-tuned to achieve maximum gain in both the 2m and 70cm amateur bands.
(2m: 3 x 5/8 and 70cm: 8 x 5/8). It has a 3 section fiberglass radome with
overlapping outer shells for added strength. It comes with stainless steel
mounting hardware and radials and strong-waterproof joint couplings.

X510NA Specifications
Frequency: 2M/70CM (144-148 and 440-450 MHz)
Gain: 8.3/11.7 dB
Power: 200 watts
Connector: N
Height: 17.2 feet
Weight: 5 Lbs.
Wind Rating: 90 MPH
We also carry the Diamond X510M which is the same antenna, but with an UHF
(SO239) connector instead of an N connector.

Universal Radio price $188.95.00 new.

$125.00 for pickup or meeting in Se, Pa. only.

| >dumped to ground is a "good thing")... at the most--they do little
harm...
|
| Hi Brett,
|
| Little Harm? It has been quite evident that electronics is quite new
| to you (contrary to whatever experience you may feel you have
| accumulated). Putting a capacitor at the output of a rectifier
| doubles the reverse voltage stress that the rectifier has to tolerate.
| If you are worried about FETs (like cutting out cholesterol for the
| sake of your appendix), then your lacking equal fear for the LEDs'
| breakdown is a bit strange.
|
| Anyway, I doubt you have actually worked through the analysis given
| all the gauche designs that lead to this. It is presumed that the RF
| will be "spike" free (the FCC frowns on such spurious content); or
| that if you are simply speaking about HF in general, then it follows
| that you could have simply dumped the RF to ground by shorting the
| Caps in the first place (no need for the useless FETs either).
|
| >I threw the second fet in because I felt guilty about having too few
| >parts!!! <innocent-look-with-fingers-tightly-crossed-behind-the-back>
|
| Uh-huh. As I said, Mad Man Muntz would have a field day.
|
| 73's
| Richard Clark, KB7QHC

Universal Radio price $74.95

$40.00 for pickup in SE, Pa. only.

pottsladd13@yahoo.com

AR6 Specifications
Frequency: 50-54 MHz
Gain: 3 dBi
VSWR 2:1 Bandwidth: >2 MHz
Power: 1000 watts FM
Height: 10.1 Feet (3.1 m)
Ring Diameter: 13 inches (33 cm)
Mast Size: 1-1.25 inches (2.6-3.2 cm)
Wind Surface: 0.37 sq. feet
Connector: UHF
Weight: 2.5 Lbs (1.1 kg)
Specifications are subject to change without notice.

Dear J. Mc Laughlin
First of all, I want to apologize for replying late.
Answers:
1. Yes, it is true.
2. No, the angle is meant to be 45 degrees. Sorry for the bad drawing.
3. The length of each dipole is an electrical 0.5 WL.
4. It is a university project. I am a postgraduate student of
"electrical and computer engineering".
5. No, it is not. In fact, I'd be rather lucky if we even manage to
construct it at all.

2291. Re: Designing and naming a prototype(?) antenna...

Source record: 77557

Does anyone have a part number and manufacturer name of a TV FM splitter also known as a tap. I did some searches and called some distributors but only found general references. Neither Radio Shack nor Blonder Tongue have this. I live very close to transmitters and would like to keep the signals as clean as possible for both my tv and radio receivers. I have new antennas and have already replaced most cable and connectors.
Thanks.

From: John Smith <assemblywizard@gmail.com>
Message-ID: <%xPfe.61$U%.1126512@news.sisna.com>
Source record: 77567

Here are some pics of the prototype I "junkboxed" together--sorry the
quality is so bad...
http://blake.prohosting.com/mailguy2/
or:
http://blake.prohosting.com/mailguy2/index.html
click on the thumbnails for larger pic(s).

The toroid has the winding grounded at center, there are 20 turns total--10
turns per side (way too many!!! I would suggest somewhere between 1-5 turns
for 10 watts or greater!!!)

And, for Richard, BOTH leds share a common current source through the FET...

Later, when I have time, will sketch the schematic and post it here...

PARTS LIST:
1) One aluminum panel to mount SO-239s'
2) Two SO-239's
3) Two hyper-brite LEDs (I would suggest LESS efficient leds--unless for
QRP--these were just handy)
4) One 1K resistor
5) One MPF-102 Fet
6) Hookup wire

If this isn't the most parts-efficient swr indicator in existance, one which
is suitable for QRP thru QRO--then I'll eat this post!!! (well, granted,
Cecils' "Two Lamp SWR Indicator" beats it--but then, this works on coax!!!)

Build one! It works!!!

Anyone know a QRP newsgroup where I can share this design with?

Warmest regards,
John

Dave wrote:
"Am fed up with the j-pole, dipole, halo variations. Anyone got
something else to try?"

Dave listed zsro-dBd gain antennas which are nearly omnidirectional.
Yes, a dipole has nulls at its ends but it isn`t sharply directional.

The next logical step may be to try a directional antenna such as the
Yagi-Uda. It has only one feedpoint and is simple but it lets you choose
the direction od your communications.

There are many examples but a good one can be found in Kraus` 3rd
edition of "Antennas" on page 248. It has anout 12 dBi (10 dBd) gain and
can be fed by 300-ohm twinlead.

With a Yagi, you can choose your direction of communications while
turning a deaf ear n other directions.

Best regards, Richard Harrison, KB5WZI

Source record: 77570

Dear Dimitris:
Thank you for the information.
I constructed a model of the antenna with 60 degrees and 0.5 WL
electrical lengths. Please see my message called "Greek Double Rhombus" of
May 3, 2005.

Because the intended frequency is very high, disregard the comments in
my message about performance above ground. Your use is almost certain to be
many WL above ground and thus the FS pattern will be close to the pattern
attained.

The high input impedance at resonance might facilitate the use of
arrays.

Good luck with your project. Let the group know how it ends.
Regards, Mac N8TT

Source record: 77572

Here is the schematic...
http://blake.prohosting.com/mailguy2/final.jpg
I am afraid this is may only good for QRP-one watt or less power...
Here is the link, this should be viewed as a starting design, far from finished--I would be interested if some QRP'ers would play with it and let me know of their experiences.

It was pointed out, that this was over-stressing components capabilites (Roy even made comment)--the FET will just not take the demands put on it at 10 watts (I ran the ten watts through a resistive splitter and sent ~5 watts too it--with a new FET, it lasted long enough for proof of concept tests... then FET blew again)

I have fets of 200+ volts (mpf-102 is 25v)--just gotta find 'em... will stick one of these in when I have time again...

I ended up with total turns of 30 on the toroid (center tapped.)

Warmest regards,
John

Or you could get back to basics. Buy a used directional coupler off of eBay.
Measure power forward & reverse, and do the simple math.

For a matched Z0=50 ohm system, five watts of forward power
is 15.8 volts. When calibrated, the voltage from the toroid
has to equal that voltage. That means, for the forward power
indication, 31.6 volts must be tolerated for five watts.

For reflected power, the current will be driven by the difference
of the two voltages. When matched at five watts, that difference
will be 15.8v - 15.8v and the LED will be dark. This might be a
hint to eliminate the forward power indication altogether and
go with only a reflected power indication. After all, the reflected
power indication is the most useful and when zero, the system is
matched.

It's not uncommon for many stores in the US to have large mark-ups on what are really cheap accessories. For instance, in many of the big electronics stores, you'll see USB cables for, e.g., $9.95 when they're more like a couple of bucks mail order! This is something of a silly game, but given the significant competition for the 'big ticket' items (computers, printers, TVs, etc.), you can see why they do this.

Keep in mind that this is the same country where coffee shops selling lattes for $3/cup are still multiplying like rabbits. :-)

Cecil:

Well, these "hyperbrite" leds I am using mask the effect a lot--but since the FWD and REW run though the same current limiter, if the REV current goes up though its' led--it starves the FWD from some of its' current--so as you see one led get brighter--you see the other grow dimmer (kewl to show to cb buddies <grin>)

But, seriously, even more desirable, is you don't need to pay any attention to the direction in which you insert it into the line....

I don't have a RF vtvm Cecil, and too lazy to build a probe... but, under test conditions something made the FET fail--I suspect too great of voltage--I have used that fet/led arrangement for "test lamps" on 5~32v with never a failure (although my datasheet on the mpf-102 says 25v max), I suspect the voltage went somewhere beyond 32v when it fail (failed in shorted condition too, both LEDS were "BRIGHT!!!!")...

But, thank you for your time in commenting--I will NOT ignore your input and keep it in mind--but still, as Roy pointed out--doesn't pay to push component capabilities to their max and beyond...
in real use at least...

Warmest regards,
John

2316. Re: impedance of end fed half wave antenna

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-10 16:11:53 UTC
From: andreas magun <achmagun@bluewin.ch>
Message-ID: <4280dd5e$1_1@news.bluewin.ch>
Source record: 77481

Thanks for all the answers. Intrigued by the lack of information
on Internet on the impedance of efhw-antennas (one value I found was
round 5kohm) I took the opportunity to become acquainted with the
EZNEC4-Demo and ran a few simulations of the efhwa as a straight wire
with the fed end near ground and an inverted V also. Considering
different geometries that could be realized by simple means I found a
large range of impedances between a few kohms up to 18kohm, probably
giving rise to high losses when matched to 50 Ohms - I have found
information on a "Z-Match using a toroidal Core Coil" by VK5BR that
shows efficiencies below 70% at 2kOhms for frequencies between 3.5
and 21 MHz, efficiency falling rapidly with increasing impedance.

On the other hand, a center fed inverted V has impedances between 36 and
52 Ohms, depending on the height (angle between wires) of the center. So
I am taking the advice of MK using this kind of antenna without any tuner.

Cheers
Andreas

Hi Brett,

So you have a choke.

You have LEDs.

You have a current limiter (that seems to fail).

OK, so why the direct connection then?

When modelling close spaced element antenma
assemblies it is possible that some elements are
physically longer than the "driven" element.
Is the length of a element sufficient enough to
declare that element a " reflector" or are there
other caveates involved.(i.e. phase)
As background to this question I would point
out that that it is possible to have two closed
spaced (positioned) elements one of which is
shorter and one of which is longer than
the "driven " element, this combination being
placed either forward or to the rear of the
"driven " element.

Hi Brett,

Automagic, more likely.

What you would like to do does not answer the why. But I will skip
that because of the more interesting ramification (kind of the
original question):
"If the FET is to limit current such that it protects the LED(s);
AND the FET fails BUT the LED(s) keep shinin' on;
What is the FET for?"

Or get even further back to basics and MAKE a directional coupler.
It's not all that difficult, and not bad to check for directionality.
RFSim99 has a tool for designing microstrip and other couplers (though
it fails to tell you that for the given coupling, the microstrip lines
should be coupled for a quarter wave distance). Hint: people who
manufacture equipment that operates in the GHz region often put
couplers right on the PC boards--biggest cost is a bit of real estate.

Answer to the question ...

You might be able to work the ISS with your setup right now. Except that it's always in packet mode nowadays ...

But beyond that, you ought to be able to work many of the low Earth orbit satellites just by adding a directional antenna. The Arrow Antenna 2m/70cm antenna is very popular for that, or there's a number of sites out there with instructions for making similar antennas. Google is your friend.

Terl <wn6bdb@hotmail.com> wrote:

| First you need a radio capable of 'full-duplex'(capable of hearing the
| downlink while transmitting on the uplink), other wise you'll just add
| to the qrm.

It's hardly essential. It's nice, but not essential. After all, most
people work the local repeaters without doing full duplex. Of course,
in that case, the repeater is usually not 200+ miles away, and
probably has 1000 watts instead of 1 watt, and probably doesn't have
10 people trying to hit it at once, but the principal is the same.

But the LEO satellites seem to be very busy unless it's the middle of
the night, and so being able to hear if you're even hitting it (or if
you're interfering with somebody else) will be very useful. But not
essential.

I suspect that what Terl is trying to state that since they're
generally so busy, if you can't do it `right', don't do it at all and
let somebody else do it. But you can do it easily enough _without_
full duplex.

You also don't _need_ a radio that can do full duplex. If you have
two radios, you can transmit with one and receive with another.
Sometimes even a standard scanner will work as the receiver, though
often they're not very sensitive.

As for how to track the satellite, your prediction program will
probably give you the approximate path of the satellite across the sky
over time. Point your antenna there. You don't need to be exact, but
you should be able to get an idea of how close you are by the strength
of the signal you receive.

The really serious people have computerized trackers, but you
certainly don't need that unless you have really high gain antennas.
(Which would probably be too big to hold in the VHF/UHF bands.)

the length itself relative to the driven element length is not sufficient to apply any particular label to an element of a parasitic antenna. it should be noted that the terms 'director' and 'reflector' are not necessarily scientific terms, they are more of a vague word description of how an element apparently works based on the observation of the antenna pattern. the real effect of each element of an antenna must be described by describing the current magnitudes and phases and the physical location of each element. a good example of this is a 2 element parasitic array, at one frequency the parasitic element may be a 'director' and at another frequency it could be described as a 'reflector'... without changing the length of either the driven or parasitic element.

>was an understatement...

Hi Brett,

If by bright you mean those dim Orange LEDs you first specified, I am inclined to believe that you have not seen "bright" at all (all advertising claims aside). The eye is a very, very poor measurement instrument of absolutes. All of this goes hand-in-hand with the total lack of quantitative information of:
1. How much forward power;
2. How much reverse power;
3. How bright forward LED;
4. How bright reverse LED;
5. How much current through either LED;
6. How much voltage across anything;
7. ALL (or any) of the above for any given load.

It is one thing to "want" to build a relative indicator - but relative to what? A Zen tune-up?

One LED gets brighter and the other dimmer? By how much? and just what is this an indication of? I posed the acid test of describing this in end-user documentation and I note its glaring absence.

It stands to reason that the circuit topologies that you offer the most are biased to shut down the weaker LED (and the reverse power, by nature of cable loss) which is guaranteed to be the weaker power.

Hence, it follows that the forward power is extinguishing the reverse indicator. It may make an interesting display, but it is decoupled from any purpose of revealing a mismatch.

... and I should have pointed out, "There is nothing wrong with women like that..." Just stops everyone from confusion and being able to claim, "I didn't know he/she was like that!"

However, I am involved directly in technical classes at a jr. college... the ratio of women to men is VERY LOW at higher classes--this is fact--not fiction--and my comment was more to that area... pointing out that technical minded men just might miss female colleges...

... indeed, I think a sexist comment would be one discouraging women from certain areas of society--not encouraging them--and pointing out they are desirable to have there... or, a condensending/shallow/protectionist comment for womens' benefits...

Warmest regards,
John

Dave
I was hoping that the IEEE would have a definition upon
which I could hang my hat on. Hate to see another quabble
like we had with TOA!
In my particular case I have two elements coupled in such
a way that even tho only one is driven the other is also of
the same phase ie. additive, all other elements are longer
than the driven element which suggests multiple reflectors,
absent an accepted definition.
Regards
Art

2338. RF Grounding and Shorting a G5RV for use on 160 Meters

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-11 00:11:41 UTC
From: Gary
Message-ID: <a9i2819ff54vm86iep9i7cqg7osucmrf5n@4ax.com>
Source record: 77502

I'm thinking of tossing up a G5RV and perhaps using it at times on 160 meters by shorting the braid and center conductor. What do I need for buried radials ? Will several 40' - 50' radials work satisfactorially or would one ~125' radial be best ? I could run a 125' radial but not in a straight line

I'm planning on using No. 14 Ga solid insulated wire. I think I've read in this newsgroup that the buried wire doesn't have to be bare ?

Also does anyone have a more elegant way of shorting the inner conductor and braid together than the half axxed contraption I'd cobble together ;) ?

Thanks in advance.

Gary

Several shorter radials will definitely be better than a single long one.

> I'm planning on using No. 14 Ga solid insulated wire. I think I've

Yes, that's correct.

> Also does anyone have a more elegant way of shorting the inner

It's hard to say how to make something better than something for which
we have no description. Surely it can't be too hard to short two
conductors together.

Richard:

Well, yeah. When I started out, I was thinking the REV LED would extinguish at match... and while that might happen at very low power levels--I've abandoned that idea (at least with hyperbrite leds)...

The second error I made was assuming my problem would be getting the LEDS to glow bright enough, I mean my "other" swr meter uses a 100 ua meter--this thinking was in slight ERROR! (just a question of how much power I want to burn--but can always use a switch to cut out "meter" in reg operation.

And, following along that line hyperbrite LEDS were a BAD idea... those things glow bright enough a 5 ma to read a newspaper by!!! (well, that could be exaggerating)

Most of these designs work, some better than others--and now I accept the fact that even a 1:1 match will just be shown as a much reduced light output on the REV LED--I accept this and just "zen tune" for min light (still thinking about your reccomendation for max. SMOKE!!! <grin>)

I am pausing here, it works, I dropped in a BUZ100 as current limiter--20+ amps max 200+v, ultra-low "R" at turn on--hard to drive at this power level in a linear fashion--but doable, and it was in my junkbox--trying to find a way to use this fact to my advantage--just let it try to burn that turkey out!!! It works--but improvements are in my mind.... time for me to think about all this and what I have learned up to this point--I have a re-newed appreciation for swr...

I have an old tube layfayette comstat 25A boatanchor I have been going to put on 10 meters, think I will focus on that now--will give me a 5 watt rf source and I will drop in a switch to drop B+ so can get a ~QRP level out the back... I will be building a vfo for it...

I need a tube set (very forgiving of high swr and direct shorts), all my other equip is solid state and I grow careless with "the movement of the planet Earth"

(or time <grin>)...

Warmest regards,
John

Thanks Roy, I can certainly short two conductors together. I was just
thinking of minimizing any amount of stray RF that might arrise given
my propensity to make Rube Goldberg type contraptions out of something
that should be an easy task. ;)

A good alternative - if you can find them - are the Belling-Lee "O-Z"
banana plugs, available in 3mm and 4mm diameters.

For data, see http://uk.farnell.com (no "www") and enter 317147 in the
Search box. Under "Tech Info" you can click the little page icon to see
a PDF data sheet.

The data sheet doesn't say so, but they are silver-plated. I've used
them outside for years, with no noticeable corrosion. Also the Z-shaped
spring in the plug is very easy to re-tension with a thumbnail.

Hello,
I have downloaded the EZNEC 4.0 (demo version) on my Windows XP laptop.
But I can't seem to install it. It's giving the following error:

"C:\WINDOWS\SYSTEM32\AUTOEXEC.NT. The system file is not suitable for
running MS-DOS and Microsoft Windows applications. Choose 'Close'
to terminate the application."

Can you please help me with this?

Thanks!

One question, if shorting the leads to feed the g5rv "marconi style",
would it be better to connect the single wire to the antenna tuner's
random wire connection, or to the coax connection, or does it matter?

Source record: 77441

Hi,

Say, I've got a question about something I've read about the Swift gamma ray detection satellite. It's detector consisted of an antenna composed of 52,000 lead blocks arranged by computer generated pseudo-random locations and glued to the back of a sheet of 4x8 plywood. The actual detectors where located in the spaces between the blocks. It wasn't mentioned but I think these were probably crystals which give off a pulse of electricity every time they are struck by a gamma ray.

Anyways my question is, in your opinion, what is the purpose of the pseudo random arrangement of this "apperture mask" antenna? I suspect it has something statistical related to the nature of ambient noise signals. I tried making a pc simulation of this but I get the same answer whether the array is in rows or pseudo-random. I tried with noise but I saw no reduction. I haven't tried adding a signal to the noise in the simulation yet though...

The discovery of the Microwave Background Radiation was even predicted
but it was accidentally discovered first by microwave antenna
designers (Arno Penzias & Robert Wilson) who couldn't explain why
their figures didn't agree with the measurements once the antenna was
built. It would have been forgotten about but luckily they had read
about the earlier prediction and contacted the scientist (Robert H.
Dicke). A Nobel Prize was awarded...

Art Unwin wrote:
"When modeling close spaced element antenna assemblies it is possible
that some elements are physically longer than the "driven" element. Is
the length of an element sufficient to declare a "reflector" or are
there other caveats involved (i.e. phase)?"

Art answered his own question. The element doesn`t care how it gets a
leading (capacitive) current, or a lagging (inductive) current.

In our broadcast curtain antenna arrays, we used an RCA WM-30A phase
monitor for the current angle in the ibnductive parasitic reflectors.
Phase was adjusted to spec with a short-circuit stub connected to where
the feedpoint would be if it were a driven element.

Kraus is unequivocal on page 245 of edition no. 3 of "Antennas":
"When the halfwave parasitic element is inductive (longer than its
resonant length) it acts as a reflector. When it is capacitive (shorter
than its resonant length) it acts as a director."

Best regards, Richard Harrison, KB5WZI

How much current will actually flow in the center conductor of the shorted coaxial feedline? The single wire connection makes much more sense.

I never liked the G5RV antenna since it just seemed like a high loss method of feeding a 102 ft piece of wire.

Interesting.
One respondent says position is a factor and the
other says it is not according to Kraus ,who may
well have been directing his comments at a Yagi
model So I changed the feed point on my model,
which is not a Yagi, to other elements to see if
they lagging or leading.
Surprise !
Some of the other elements were resonant also
thus they could be fed in one or more places
at the same time
Since with the initial design they are not all
directly fed these apparently do not fall into any
catagory.
I suppose literature in general can only apply
definitions to that which is known by the author
at the particular time
Regards
Art

The following is based on an analysis I did for a ham Friend. Consider a 102 ft bent dipole (REF: Richards Antenna v4), fed in the center with 33ft of 300 ohm tubular, followed by 25 ft of 75 ohm twin.

Frequency Total feedline loss
(MHz) (dB)

1.8 24.8
3.8 4.9
7.1 2.4
10.1 10.2
14.1 1.4
18.1 3.0
21.2 9.1
24.9 2.7
28.5 3.9

If you are interested I can e-mail you the complete analysis in Microsoft Word showing various feedline combinations from 1.8 to 30 MHz. If you have a particular structure in mind I can also do the analysis. I use NEC2 based software in combination with the ARRL's transmission line analysis program.

Regards,

Frank

Well, everything stated may be true... but I have never seen a beam where
you would confuse the reflectors from the directors by physical size... if
in doubt and you wish to confirm this--just look up!

Warmest regards,
John

Good question. In this case, the more difference in the two
currents, the greater the radiation from the horizontal section.

> I never liked the G5RV antenna since it just seemed like a high loss method
> of feeding a 102 ft piece of wire.

Actually, if the purpose of the matching section is to lower
the SWR (and thus the losses) on the coax, it does a reasonable
job on 80m, 40m, 20m, and 12m. But forget the other four bands
unless you change the length of the matching section.

It is extremely tough reading. It is virtually impossible
to use the English language to discuss the non-existence
of time. I had to keep asking myself: "If time doesn't exist
and has never existed, what is this English sentence trying
to say?" Seems to me, "time" is a concept introduced by man
in order to catalog and correlate changes. We are the only life
form on earth that requires the concept of time, just as we
are the only life form on earth that requires the concept of
a creator.

Cecil:

We do not require a "creator." We do require a plausable explaination of how this all exists...

Specifically, my one burning question I want the answer to is "where did I come from?" (Well, I already know what my mom and dad were doing and their part in this whole mess... <grin>)

Frankly, if my distant relatives are apes... well, I can handle that--but STILL they WON'T be invited for xmas or a sons wedding!!!

However, there just is no way of knowing with present knowledge--without a leap of faith in one direction or another--I simply loath evolutionists for attempting to promote their religion as "the one true religion." They are simply as bad as the rest...

Warmest regards,
John

Well Cecil:

You know me and my fondness for "tweaking" electrical lengths <grin>... I suspect it is more than possible to have 'em the same length, and indeed, you seen the folded 1 wave monopole I played with, it did exhibit side "nulls."

Now, as to if the gain of the beam you point out is exactly equal or better, I doubt--as opposed to one being longer/shorter director/reflector (remember, I still ponder the ethers part in all of this--and NONE of our formulas take it into account)... but besides all of this...

I JUST HAVEN'T SEEN ONE!!!!

And, you know I am a hopeless "Assumer"--I dare to assume if it were such a great idea, I'd see a bunch---but then, I am open to a discovery here!!!

Come on Cecil, with so many after my scalp--I can't afford losing any hair to you!!! <grin>

I gotta get some work done here--I am turning off message notification... I will read/respond to your come-back later... <grin>

Warmest regards,
John

Seems to me Cecil that the terms "Reflector" and
"Director" are very poor words to describe antenna
elements for an HF array .
I have oft times changed a single element into two
closely coupled elements and where one is short
and one is long relative to a driven element
I wonder who was the first to assign these terms
Or was it a poor translation from Japanese (Uda and Yagi) ?
Regards
Art

2392. Used 80-6 HF Antenna - What Do I Have?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-11 19:21:30 UTC
From: Little O'Me <me@here.com>
Message-ID: <eim481dlr7viriggscg4mc5r78f5jeg4eg@fe02.buzzardnews.com>
Source record: 77457

Greetings to all the resident knowledge in this group.

I am trying to figure out what HF antenna I have. I bought it at an estate sale. It was mounted in the ground, without radials, but connected to a ground rod in the ground alongside the antenna. It was "at the beach", so while it is in overall pretty good shape there is some corrosion in places, and the UV has gotten to a couple of other places. I have gotten it on the air, and it covers 80-6 meters. I am hoping to be able to get a manual and perhaps some replacement parts.

It is SIMILAR to an R7, but it is not an R7. The key points are that it does not have the base or middle radials, the matching network is different, the mounting is different and this covers 80-6 meters. It does have the stubs like an R7, however. I have searched CushCraft, Hustler, HyGain and Gap, and it does not appear to be a product made by any of them, based on online manuals of past and present models. Here goes the description, and I hope someone can point me in the right direction.

BASE
The base of the antenna is a 10 inch sleeve, 2 inch OD. The antenna mounts by slipping over a mounting pole, not alongside with U-bolts as is the case with just about everything else.

MATCHING NETWORK
The matching network, if that's what it is, is a "tuna can", about 1-1/2 inches in diameter and 1-1/2 inches high. There is an SO-239 on the bottom, which has some corrosion and the coax center conductor is not making good contact. There are little L-shaped tabs on the top and bottom, the bottom one going to the skirt/sleeve, and the top to the start of the radiating element.

SECTION 1
This section is 85 inches long, topped with a 1 inch coil the same diameter as the aluminum tubing. Near the top is an L-shaped stub. Near the top of the stub is a support which is clamped to the next aluminum section.

SECTION 2
This section is 4 inches long, topped with a 3/4 inch coil the same diameter as the aluminum tubing. Near the top is an L-shaped stub. Near the top of the stub is a support which is clamped to the next aluminum section.

SECTION 3
This section is 6 inches long, topped with a 3-1/2 inch coil the same

diameter as the aluminum tubing. Near the top is an L-shaped stub. Near the top of the stub is a support which is clamped to the next aluminum section.

SECTION 4
This section is 3-1/4 inches long, topped with a 2 inch coil the same diameter as the aluminum tubing. Near the top is an L-shaped stub. Near the top of the stub is a support which is clamped to the next aluminum section.

SECTION 5
This section is 12 inches long, topped with a 3 inch coil the same diameter as the aluminum tubing. Near the top is a U-shaped stub. Near the top of the stub is a support which is clamped to the next aluminum section.

SECTION 6
This section is 24 inches long, topped with a 2-1/4 inch coil the same diameter as the aluminum tubing. Near the top is an L-shaped stub. Near the top of the stub is a support which is clamped to the next aluminum section.

SECTION 7
This section is 36 inches long, topped with a 6 inch coil the same diameter as the aluminum tubing. Near the top is an inverted U-shaped stub. Near the top of the stub is a support which is clamped to the next aluminum section.

SECTION 8
This section is 76 inches long. Approximately 6 inches from the bottom are two 24 inch horizontal elements, looking like 12 inch radials. I suspect these are some form of capacity hat.

That's about it. Any help anyone can provide would really be appreciated.

73,

Rick, WM6M

It's hard to say, because too many variables are involved. What I'd do is to model the antenna with EZNEC and if the impedance is high use the random wire connection and if low the coax connection.

In article <aobge.168$D7.11944078@news.sisna.com>,
John Smith <assemblywizard@gmail.com> wrote:

| ... and I should have pointed out, "There is nothing wrong with
| women like that..." Just stops everyone from confusion and being
| able to claim, "I didn't know he/she was like that!"
|
| However, I am involved directly in technical classes at a
| jr. college... the ratio of women to men is VERY LOW at higher
| classes--this is fact--not fiction--and my comment was more to that
| area...

In college I studied physics and astronomy -- few women there.

And now, my hobbies are R/C planes and ham radio -- there's few women in these hobbies, especially flying R/C. In fact, I think I've seen no more than two women flying R/C planes. Ham radio is a little better, but not much.

At work, I do computer support and sys-admin stuff. There's a few women here, but they're outnumbered by the men at least five to one. In retrospect, it sounds like it's amazing that I ever met any women and got married at all -- most of the things I do seem to be male dominated!

Over the years, I've learned that generally, the few women that are in male dominated areas tend to get a lot of attention from the guys. Not because they're good at what they're doing, but because they're women.

If a woman is doing one of these things, it's probably because she likes it. She probably wants to be treated as an equal, but instead many men treat her like she's special -- but only because she's a woman.

| pointing out that technical minded men just might miss female
| colleges...

Did you mean to say colleagues rather than colleges? Certainly, in college, the very few women in the physics classes were certainly not missed by the guys. And the last women I saw flying an R/C plane was young and attractive, and the guys were paying her all sorts of attention. (To be fair, in that case she didn't seem to mind. I think she was just there with her boyfriend, and he talked her into trying it.)

`Where have you been all my life?' is something that I've heard of being used at bars. And generally women don't really like lines -- it suggests that they're stupid, that they're going to fall for that old line or something. It's probably not so bad in a bar, where the man:woman ratio is probably closer to unity.

But if a woman enters the ham radio hobby (or R/C hobby, or engineering program in college, or ...) she's suddenly inundated by guys asking her where she's been all their life. Some like it, but most don't. Especially when they want to be taken seriously for their mind or their skills, not for the fact that they're women.

| ... indeed, I think a sexist comment would be one discouraging women
| from certain areas of society--not encouraging them--and pointing
| out they are desirable to have there...

... but only because they're a woman. Or do you ask the men where they've been all your life too?

I've posted questions here about satellite antennas here somewhat recently. I don't recall anybody asking where I'd been all their life.

| or, a condensending/shallow/protectionist comment for womens'
| benefits...

I assume that's how you saw my comment? At least I made an effort to answer her question. I'm hardly a protectionist -- I'm just suggesting that you treat the women just like you treat the men. Do you regularly walk up to women you don't know and ask them `where they've been all your life?'

There's probably more women online than you realize. However, a lot of them go by gender neutral or male names just because they don't like the attention that being openly female gets them.

I'm not saying you were trying to be condescending, but to many women, that's exactly how it comes across. And since there's so few of them, and so many men, it happens a lot to each of them. And so quite often women get tired of it, and either hide or just find another hobby.

To keep this at least somewhat on topic ...

The FT-60R she has, I don't think it'll do full duplex. The most popular LEO 2m/70cm antenna for handheld use appears to be the http://www.arrowantennas.com/146-437.html (or something that's basically the same), and by default it has two coax plugs. If she has a scanner, she could transmit on one plug, and plug the scanner into another, and work full duplex that way, and she won't even need to buy the duplexer/diplexer.

Asimov,

I believe you have misinterpreted the geometry. The detector array is some distance behind the aperture array, perhaps one meter or more. The concept is that of a simple shadow mask. There are 52000 shadows on 32000 detectors, so the details of the computation are probably a bit complex.

I recommend a paper by Scott Barthelmy, which is available at

http://swift.gsfc.nasa.gov/docs/swift/news/2005/AAS_Jan05_SBarthelmy.pdf

Art,

Think again about what you wrote.

"I have oft times changed a single element into two closely coupled
elements and where one is short and one is long relative to a driven
element."

Why would you mis-attribute your application of standard terminology to
a new experimental situation as a "poor translation"?

The appropriate terminology for the various elements is generally pretty
clear from the physical design and performance of a Yagi antenna. When
your experiments go beyond the original design you are on your own.

Exactly Gene.
This is why the thread asked for a "definition" first for director and
reflector.
As you are probably aware a yagi reflector does not reflect anything.
Some would say that a dish "reflects but not a element.
I am still a bit gun shy after the last episode where TOA was not
defined in the IEEE dictionary thus many feined knowledge on the subject.
I suspect tho that the nomenclature started with the Yagi and then
spread to other array design descriptions.
If however a Yagi reflector does actually "reflect" then your scolding
is correctly directed at me.Perhaps we should first look in a dictionary
for the word "reflector"

What is your theory as to what caused God? If you believe in "First
Cause", then God has to have a cause and whatever caused God has to
have a cause, ad infinitum. If, OTOH, you don't believe in "First
Cause", then the Big Bang didn't have to have a cause - your choice.

The mass/energy involved in the Big Bang ensures that 5 minutes
earlier than the Big Bang never existed and could never have
existed - see relativity. Time is impossible until an event
horizon exists which it didn't "before" the Big Bang.

From the IEEE Dictionary: "reflector element - A parasitic element
located in a direction other than forward of the driven element
of an antenna intended to increase the directivity of the antenna
in the forward direction."

"director element - A parasitic element located forward of the
driven element of an antenna, intended to increase the directivity
of the antenna in the forward direction."

By this definition, a log-periodic has no reflectors and no
directors.

Yes, I see that Cecil, but I suspect he is not a ham
and thus would not know the difference between
different arrays. But if he is really looking for "Aliens"
he may well be looking in the right direction but his LED's
have a skewed correct "reflector".
With respect to your two element example you stated that
they were both driven. When coupled correctly it is only
necessary to feed one element in an array and allow the
coupled element to be of similar phase and if possible
of a higher current flow to give you that 3 db additive
advantage . Plus single digit elevation angle for max gain
even tho the array is fed at 1 WL height.(20 metres)
I could send you actual model details if it is of interest.
Or a photo if that interests you more.
Regards

Art

Rick -

It sounds like you are describing"open coils" (and not enclosed traps)
Sounds like the Bencher HF9VX which is 80 through 6 meters and stands about
26 feet tall. It does not require radials IF the CPK Capacitive
Counterpoise Kit is used.
http://www.bencher.com/hf9vx.html

Manual for 1997 to Present model:
http://www.bencher.com/pdfs/00408IZV.pdf

Manual for earlier model 1989 to 1997 (used HF-6 as base)
http://www.bencher.com/pdfs/00233IZV.pdf

Bencher any replacement parts you may need (about 5 miles north of my QTH).

Interesting Cecil. Not only does it rely only on position versus
the driven element but they use the term reflector
in the same breath as a parasitic device!
Presumably length is not a factor.
Mirror, Mirror on the wall now we will call you a parasite
depending who is looking at you
Just don't paint your antenna and use plenty of LED's so that
the shiny surfaces will reflect. I give up, there are to many
conflicting definitions.
In my case it would appear that I have one driver, six reflectors and one
parasitic driver, that should be explicit enough.
Thanks everybody for your help

The base description you say it is like a Cushcraft vertical antenna.
When you said 85" .. I immediately thought of the AV-5 (but it can't run on
6 meters - that I am aware of)
Cushcraft have made many vertical antennas (both 1/2 wave and 1/4 wave);
R3, R4, R5, R6, R6000, R7, R7000, R8 (1/2 waves)
AP8(A), AV-3, AV-4, AV-5
==========
R5 1/2 wave maintenance and repair
http://home.planet.nl/~fhvgeerligs/Ant/R5/onhr5eng.htm

AP8 (PowerWave)
http://mega.ist.utl.pt/~cmao/ham_radio/ham-04.html

AV-x series (the AV-4 and AV-5 had a "X" capacity hat)
I owned the AV-3 in the 1980s - nice 1/4 wave antenna - does need radials
http://www.cushcraft.com/support/pdf/av3482.pdf

No doubt, but there are leaps of faith, and there are leaps of faith.
One type allows you to believe that things happened a certain way, and
you will argue for it.

The other causes you to pray to it, structure your life around it, and
to be prepared to engage in physical battle with those who disagree with
you.

2423. Student Rocket Part II

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-12 02:16:36 UTC
From: Paul@Rasdoc.com
Message-ID: <vpe581h7pmgt8ks35isu10sdg7v6s7ralq@4ax.com>
Source record: 77384

I'm still playing with the rocket antenna.
The rocket body is a 12 inch diameter aluminum tube.

If I want to put a horzintal dipole on the body I can do one of two things.

1)Cut an Oval or oblong hole in the skin up near the electronics and then put in a fibnerglass panel, on that panel I put a cu foil dipole.

How much bigger does the opening around the dipole have to be to not reduce the efficency of the antenna.

2)I can put a thin dialectric patch on the outside of the rocket and put the antenna on that.
How thick would a fiberglass dielectric need to be for a good antenna?

I now have a 900Mhz capable bird so I can trim the antenna for minimum SWR.

This sunday is my last chance to make all of this work so I'm running out of time.

Paul (Kl7JG)

Thanks, I think we are close! Mine is 9 bands, and easily tunes 6
meters, but otherwise it looks like the AP-8(A).

Thanks for your help here.

Rick -

Well Cushcraft did have a number of models.
Cushcraft does not have all of the documentation for these models on their
web site.

It sounds like you are describing "trombone capacitors" - BUT a photo would
"say a thousand words" of description.

Since you are considering cutting holes in the body, I would suggest a vertical slot dipole antenna, which at 900 MHz is 6.25" long -- not sure on the slot width, but it is << lambda/2. A vertical slot has a horizontally polarized radiation pattern. You may consider 2 or 3 vertical slots fed from a splitter to ensure complete coverage. This is a similar arrangement as used by ground based VORs -- a VHF aviation navaid. Radiation directly below the rocket is at a minimum, as it probably will be with any antenna.

Makes it infinitely easier to reckon which is the director or the
reflector - just look. If you see yourself holding the flashlight,
you are the director looking at the reflector.

Now for the real challenge:
What would you see if you looked into a conjugate mirror?

Hint(s): it won't matter much if you are holding a flashlight OR a
searchlight. No matter of semantics will change the perception
either. Nothing to close couple (you are close enough already). No
issue of size (as long as you can see the mirror frame - but having
said that, this will then turn the answer on the shape of the frame I
suppose). No impact will be discovered if there's another mirror
behind it. No one needs to worry about translation problems from
japanese. You won't find the answer in Kraus (or the IEEE dictionary
I suspect). Computation of gain comes with the answer (and in all
likelihood so will considerable error).

> antennas"--my antennas propagate a wave though a medium-
Very good, An antena array is a collection of antennas all of which
transmit interferring waves that are both additive and interfering negatives
in the far field In other words just a collection of dipole radiators. which
is then
termed as an "array" which may or may not qualify as a "beam".
For a Yagi style antenna position is all important which is not necessarily
true
for all antenna arrays, especially those of non liear form.
. In fact Uda and another guy wrote up the original design and
Yagi stepped in later to provide a translation into English .
For me I cannot see a relationship between positions of radiators other
than
with the Yagi and where the terms used suffered in the translation yet still
gave a
a mental picture that loosely matched a mirror or a reflector as an
explanation.
of how gain can occur. It would appear from the answers received
that a true definition has not yet been agreed upon that is all encompassing
in true electrical terms.

Oh yes, the important spacing--we agree on that alright (the rest too--I see
that physical/electrical length as important to--but "electrical length" and
"magnetic field shape" are related on an almost linear scale), but what is
"in" that "spacing"--now there is the nut of this... that "magnetic field"
is not a "proton projection" and my antenna does not "glow"--and that
"space" ain't no wire--or is it?

Warmest regards,
John

Hi,

Say, I've got a question about something I've read about the Swift
gamma ray detection satellite. It's detector consisted of an antenna
composed of 52,000 lead blocks arranged by computer generated
pseudo-random locations and glued to the back of a sheet of 4x8
plywood. The actual detectors where located in the spaces between the
blocks. It wasn't mentioned but I think these were probably crystals
which give off a pulse of electricity every time they are struck by a
gamma ray.

Anyways my question is, in your opinion, what is the purpose of the
pseudo random arrangement of this "apperture mask" antenna? I suspect
it has something statistical related to the nature of ambient noise
signals. I tried making a pc simulation of this but I get the same
answer whether the array is in rows or pseudo-random. I tried with
noise but I saw no reduction. I haven't tried adding a signal to the
noise in the simulation yet though...

John Smith wrote:
"Oh yes, the important spacing--"

Proximity determines induction in a parasiteic element. Far from an energy source, the parasite captures little energy and re-radiates little. The mutual impedance between elements is small when spacing is large.

A parasite must be nearly resonant to become excited. Behavior is similar to a reed in a resonant-reed frequency indicator. The resonant reed is strongly excited. Other reeds are little excited at the wrong frequency. An out of tune antenna element has its current impeded by reactance. A resonant element has no reactance.

Detuning a parasitic element is slight if excitation is to be maintained, but it is enough to make the element reflect or direct as desired.

Magnetic fields are naturally produced around current-carrying conductors and around displacement currents too. Electric and magnetic force lines are mutually perpendicular. In space, the plane containing crossed electric and magnetic lines is called the wave front. Travel direction of the front is perpendicular to the crossed electric and magnetic lines.

Wave theory accurately predicted radio behavior before anyone thought of acceleration causing photon emissions.

Best regards, Richard Harrison, KB5WZI

"John Smith" bravely wrote to "All" (11 May 05 22:25:13)
--- on the heady topic of "Re: Reflector Vs Director"

The only thing I know is that an antenna is a tricky compromise
between a myriad of physical constants that make it up. Simply
changing the dimensions of an element will affect the optimum spacing
for maximum gain. But then so too having maximum gain as a goal will
often reduce bandwidth. So some compromise to gain/bandwidth must be
made to have a real antenna at the end of the process. Many such
mutually defeating compromises must be juggled with to achieve this.
Then, as if this wasn't enough, one must add the interaction with the
environment, thinks like weather, proximity to objects, noise, etc.

Yeah, unless I'm mistaken mountain gorillas were officially discovered in
1902, I'm pretty sure their species evolved a good deal more than a million
years ago also. There are blurbs on the net right now dealing with a new
great ape species. We have to remember modern science is really only about a
hundred years old.
We seem to be discovering new species almost as fast as we are
pushing existing ones into extinction.

Source record: 77408

NEW PROGRAM

Program VERTUNE.exe analyses performance of half-wave, end-fed,
vertical and similar antennas. See how power losses are distributed.

A parallel L and C tuned circuit Z-matches the high impedance
feedpoint to a coaxial line. Coil design, (dimensions, wire gauge,
turns) is included.

High radiating efficiency can be acheived with a poor ground electrode
system.

Download VERTUNE (41 kilobytes) in a few seconds, no un-zipping
inconvenience, and run immediately.

If I lay two marbles on a flat sheet on a bed, and their spacing is close--I take my finger and push one marble down into the material of the bed--so as it deforms or "warps" the shape of the bedding, the other marble is "pulled" towards it--if the two marbles are far apart--the second is unaffected...

If ether has a property similar to that bed, I can warp that ether and cause objects to be affected--in relationship to their proximity to the "warp" I am causing...

If I place a piece of paper over a magnet--gently sprinkle iron powder over the paper--I see lines--claimed to be a "magnetic field"....

... do you think these "lines" are photons (waves?)shooting from one end of the magnet to the other (of course they would actually be lying outside the metal of the magnet in a "static" state).... or is this iron powder a "warping" of the ether I am looking at?

Warmest regards,
John

> RC> You probably won't unless you have deconvolution math behind it.
>Would you please, explain?

Hi Isaac,

The technique is one of a suite of tools derived from Fourier analysis. The background signal contains a random response that is largely immutable. That signal can be used as a key (if we were to use the parlance of cryptography). The signal of interest still appears to be just as random - in isolation. However, when both are "mixed" (if we were to use the idiom of electronics), then the signal of interest rises out of the noise.

It is not a simple mixing process, however, because in that idiom we don't know the center frequency - so to speak (and instead of getting clear speech in the typical SSB application we get something that sounds like Donald Duck at best).

However, in Fourier analysis, you can slip the two signals past each other (akin to matching the key of the "Gold Code" of a spread spectrum signal to the incoming signal) in what is called cross correlation and the deconvolved signal will spring out as a result (when done with what is called confidence math, also found in the Fourier repertoire). To return to the idiom of the SSB application, the background noise becomes the center frequency.

The same application has been done to map the ocean floor using natural wave and wildlife noise.

John, go to Index.

Then click on "Download progs from here".

Scroll down a long list of program names.

VERTUNE is last name in the list.

Click on the name VERTUNE.

You will then be invited to "Run now" or "Save" to your computer.

After a second or so it usually appears as an icon on your desktop.

Click on the icon and away you go.

I have already received messages from people who have downloaded and
used the program OK. It's quite a complicated procedure to upload it.
It's a relief to know *I* havn't cocked it up as I usually do.

You need to define the particular aspect being conjugated. For example, the person I see in the mirror appears to be right handed. In another sense the object in the mirror moves synchronously with me as if it were coupled to me. Any mirror exhibits conjugate behavior in some sense. Perhaps you're alluding to phase conjugation - an interesting effect.

why wouldnt it?
if you raise the directed end of the antenna you are changing the angle
of radiation so you would effect the performance of the antenna
also effective if you live on a mountain top and want to work the valley
if you didnt lower the antenna it would shot right over there heads
you aim the antennas Az direction with good effect so why wouldnt
elevating the antenna has similar effect?

Source record: 77422

The simple way to find out is to model it on Eznec/4nec2 etc...

In my mind a HF yagi will never be quite high enough and there will be multiple lobes at differing takeoff angles. Changing the boom angle to the horizontal will tend to change where these lobes point so one would experience a change in gain to stations at specific distances. How much difference I dont know because I dont have a handle on how critical the refraction angle is through the ionosphere.

Cheers Bob VK2YQA

Patch antenna design is described in "Antennas" by John D. Kraus, ISBN 0-07-035422-7, pp 745 - 749. If you do not have access to this book I can scan and send you the pages.

A patch antenna consists of a conductive rectangle of dimension lambda/2 X < lambda, and mounted on a substrate over a ground plane. The longer dimension is dependant on the Er of the substrate.

73,

Frank

Gee Cecil! I have just been convinced that there is nothing you can do to an antenna to improve communication!
I am now content with the notion that propagation controls communication and nothing you can do to an antenna to change that TOA ....Grin

Just ran a 2-element 20m beam at a height of ten feet and
got a TOA of 55 degrees. Ran it at a height of 100 feet
and got a TOA of 10 degrees.

Honeycomb composite, about 2" thick and about 1/4 the area of a sheet of
plywood.

http://swift.gsfc.nasa.gov/docs/swift/about_swift/bat_desc.html

According to the web page, the answer to the original question is the
geometry of the mask elements allows the telescope to maintain its field
of view and angular resolution in the event of a wide variety of
different sensor failures.

JS> If I place a piece of paper over a magnet--gently sprinkle iron powder
JS> over the paper--I see lines--claimed to be a "magnetic field"....

JS> ... do you think these "lines" are photons (waves?)shooting from one
JS> end of the magnet to the other (of course they would actually be lying
JS> outside the metal of the magnet in a "static" state).... or is this
JS> iron powder a "warping" of the ether I am looking at?

The lines are the after-effects of placing the iron powder in the path
of "virtual" photons. These are photons that exist too briefly to be
detected. Spacetime is not an empty vacuum but is a frothing of energy
and virtual particles of all kinds. The virtual photons responsible
for the observed permanent magnet's field travel only a small fraction
of a wavelength but their wavelength is almost infinite.
(i.e. c/F=infinite, when F=zero).

Hi Jim,

In fact I don't (which is the whole point of ANY characteristic being
conjugated) because it doesn't matter. There is no aspect (of what
you observe) that is without its conjugate being mirrored. However,
your presumption:
>the person I see in the mirror appears to be right handed.
already disqualifies your answer.

The "effluvium" as you described it, was literally true, and
necessary. Being ignored, it has precipitated my projected
expectation:
>>... Computation of gain comes with the answer (and in all
>> likelihood so will considerable error).

The "effluvium" as you described it, was literally true as the
discussion (also anticipated) has been reduced to the frame of the
mirror (as so commonly happens in these threads) while abandoning the
substance of the conjugate mirror. This, of course, compounds the
observation above about the rapid descent into errant discussion.

Anyway, the original challenge:
What would you see if you looked into a conjugate mirror?
is meaningful within the context of the Subject line, but perhaps is a
bit too abstract (after all, it does require a knowledge of sight and
conjugation, not a simple coupling of experience). For those who
fear Shakespeare, there is only one three syllable word.

Someone may yet stumble on the answer. ;-)

Asimov:

Then:

If I were shrunk to the size were an atom is the size of an orange and, I am
holding it in my hand--and I look over at the next closest atom, in the
block of lead I am standing in, and it appears to be about a football field
length away... and if we agree on the preceeding... I have a LOT of this
"free energy" and "virtual photons" in my body--correct?

Indeed, my antenna has a LOT of it, in its' metal, does it not? And, it is
swimming in it, is it not? And, if so, kinda strange no formula takes that
into account, right?

Warmest regards,
John

JS> If I place a piece of paper over a magnet--gently sprinkle iron powder
JS> over the paper--I see lines--claimed to be a "magnetic field"....

JS> ... do you think these "lines" are photons (waves?)shooting from one
JS> end of the magnet to the other (of course they would actually be lying
JS> outside the metal of the magnet in a "static" state).... or is this
JS> iron powder a "warping" of the ether I am looking at?

The lines are the after-effects of placing the iron powder in the path
of "virtual" photons. These are photons that exist too briefly to be
detected. Spacetime is not an empty vacuum but is a frothing of energy
and virtual particles of all kinds. The virtual photons responsible
for the observed permanent magnet's field travel only a small fraction
of a wavelength but their wavelength is almost infinite.
(i.e. c/F=infinite, when F=zero).

NEW PAYPAL MARKETING TECHNIQUE USING THE OLD 5 LETTER TECHNIQUE CAN MAKE THOUSANDS!! If you are reading this right you should feel privileged because this is the first time this idea has hit the nation.

Remember that old business of sending $5 to 5 people (which actually works believe it or not) and then adding your name to the list so that people would send money to you? If not we will explain in a minute, if so you must read the following. We have designed the same system to be used with PayPal which means you no longer have to give out your name, home address, or send out 5 letters.
Now, you can become instantly involved without ever leaving the computer in a matter of minutes. Image, thousands of dollars in your paypal account and all you have to do is finish reading this letter!! The Oprah Winfrey Show and investigative program 20/20 recently devoted a whole segment on this program to see if it really can make people money and was legal.

Parents of 15 year old find $71,000 hidden in his closet! Proven by National TV programs as 100% legal, feasible and true! Due to the recent increase in popularity and respect this program has attained, it is currently working better than ever. It is working so well, people are entering the program for second and third times. You most likely have just seen this story recently featured on a major nightly news program (USA), and reported elsewhere in the world.

His mother was cleaning and putting laundry away when she came across a large brown paper bag that was suspiciously buried beneath some clothes and a skateboard in the back of her 15-year-old sons closet. Nothing could have prepared her for the shock she got when she opened the bag and found it was full of cash. "My first thought was that he had robbed a bank", says the 41-year-old woman, "There was over $71,000 dollars in that bag -- that's more than my husband
earns in a year".

As it turns out, the boy had been sending out, via E-mail, a type of "Report" to E-mail addresses that he obtained off the Internet. Everyday after school for the past 2 months, he had been doing this right on his computer in his bedroom.

"I just got the E-mail one day and I figured what the heck, I put my name on it like the instructions said and I started sending it out", says the clever 15-year-old.

The E-mail letter listed 5 addresses and contained instructions to send one $5 dollar bill to each person on the list, then delete the address at the top and move the others addresses down, and finally to

add your name to the top of the list.

The letter goes on to state that you would receive several thousand dollars in five-dollar bills within 2 weeks if you sent out the letter with your name at the top of the 5-address list.

"I get junk E-mail all the time, and really did not think it was going to work", the boy continues. Within the first few days of sending out the E-mail, the Post Office Box that his parents had gotten him for his video-game magazine subscriptions began to
fill up with not magazines, but envelopes containing $5 bills."About a week later I rode down to the post office and my box had 1 magazine and about 300 envelops stuffed in it.

Over the next few weeks, the boy continued sending out the E-mail. "The money just kept coming in and I just kept sorting it and stashing it in the closet. I barely had time for my homework".

Fortunately, the boy did not have any reason to be afraid about the legality of this program. The reporting news team examined and investigated the so-called "chain-letter" the boy was sending out and found that it was not a chain-letter at all.

In fact, it was completely legal according to US Postal and Lottery Laws which state a product or service must be exchanged for money received.

Every five-dollar bill that he received contained a little note that read, "Please send me report number XYX". This simple note made the letter legal because he was exchanging a service (A Report on how-to) for a five-dollar fee.

ITS TRUE! THE TEENAGE BOY LEGITIMATELY EARNED $71,000. YOU SHOULD PRINT THIS, READ IT AND FOLLOW THE SIMPLE INSTRUCTIONS. YOU TOO CAN MAKE $71,000 AND MORE!

If you would like to make at least $500,000 every 4 to 5 months easily and
comfortably, please read the following...then read it AGAIN and AGAIN!

FOLLOW THE SIMPLE INSTRUCTIONS BELOW AND YOUR FINANCIAL DREAMS WILL COME TRUE - GUARANTEED!!

PLEASE NOTE: You no longer have to use snail mail to participate in this wonderful money making technique.

INSTRUCTIONS:

Order all 5 reports shown on the list below. To order the reports simply use your existing PAYPAL account or create a PayPal account (which is free) and send $5 to the email address whose name appears ON THE LIST next to the report. To do this, log into your Paypal account and simply goto the send money option. Enter the email address and

include in the notes area the NAME AND NUMBER of the report you are requesting as well as your email address. PAYPAL'S WEB ADDRESS IS: www.paypal.com/us/mrb/pal=98WJRCZSQQL2L

When you place your order, make sure you order each of the 5 reports. You will need all 5 reports so that you can save them on your computer and resell them.

YOUR TOTAL COST $5X5 = $25.00.
Within a few days you will receive, via e-mail, each of the 5 reports from these 5 different individuals. Save them on your computer so they will be accessible for you to send to the 1,000's of people who will order them from YOU. Also make a floppy of these reports and keep it on your desk in case something happens to your computer.

IMPORTANT - DO NOT alter the email addresses of the people who are listed next to each report, or their sequence on the list, in any way other than what is instructed below in steps '' 1 through 6 '' or you will lose out on a majority of your profits. Once you understand the way this works, you will also see how it does not work if you change it.

Remember, this method has been tested, and if you alter it, it will NOT work!!! People have tried to put their friends/relatives names on all five thinking they could get all the money. But it does not work this way.

1.... After you have ordered all 5 reports, take THIS advertisement and REMOVE the email address in REPORT # 5. This person has made it through the cycle and is no doubt counting their
fortune!

2.... Move the email address in REPORT # 4 down TO REPORT # 5.

3.... Move the email address in REPORT # 3 down TO REPORT # 4.

4.... Move the email address in REPORT # 2 down TO REPORT # 3.

5.... Move the email address in REPORT # 1 down TO REPORT # 2.

6.... Insert YOUR email address in the REPORT # 1 Position.

*PLEASE MAKE SURE you copy every email address accurately!

Take THIS entire letter, with the modified list of emails, and save it on your computer.
DO NOT MAKE ANY OTHER CHANGES.

Save this on a disk as well just in case if you lose any data. To assist you with marketing your business on the internet, the 5 reports you purchase will provide you with invaluable marketing information which includes how to send bulk e-mails legally, where to find thousands of free classified ads and much more.

There are 2 Primary methods to get this venture going:

METHOD # 1: BY SENDING BULK E-MAIL LEGALLY

Let's say that you decide to start small, just to see how it goes, and we will assume You and those involved send out only 5,000 e-mails each.

Let's also assume that the mailing receives only a 0.2% response (the response could be much better but lets just say it is only 0.2%. Also many people will send out hundreds of thousands of e-mails instead of only 5,000 each). Continuing with this example, you send out only 5,000 e-mails.
With a 0.2% response, that is only 10 orders for report # 1. Those 10 people responded by sending out 5,000 e-mail each for a total of 50,000.

Out of those 50,000 e-mails only 0.2% responded with orders. That's 100 people responded and ordered Report # 2.

Those 100 people mail out 5,000 e-mails each for a total of 500,000 e-mails. The 0.2% response to that is 1000 orders for Report # 3.

Those 1000 people send out 5,000 e-mails each for a total of 5 million e-mails sent out. The 0.2% response to that is 10,000 orders for Report # 4.

Those 10,000 people send out 5,000 e-mails each for a total of 50,000,000 (50 million) e-mails.
The 0.2% response to that is 100,000 orders for Report # 5.

THAT'S 100,000 ORDERS TIMES $5 EACH=$500,000.00 (half a million).

Your total income in this example is:

1..... $50
+ 2..... $500
+ 3..... $5,000
+ 4..... $50,000
+ 5..... $500,000 ....

Grand Total=$555,550.00!

NUMBERS DO NOT LIE!
GET A PENCIL & PAPER AND FIGURE OUT THE WORST POSSIBLE RESPONSE AND NO MATTER HOW YOU CALCULATE IT, YOU WILL STILL MAKE A LOT OF MONEY!

REMEMBER FRIEND, THIS IS ASSUMING ONLY 10 PEOPLE ORDERING OUT OF 5,000 YOU MAILED TO. Dare to think for a moment what would happen if everyone or half or
even one 4th of those people mailed 100,000e-mails each or more?

There are over 150 million people on the Internet worldwide and counting. Believe me, many people will do just that, and more!

METHOD # 2 : BY PLACING FREE ADS ON THE INTERNET
Advertising on the net is very very inexpensive and there are hundreds of FREE places to advertise. Placing a lot of free ads on the Internet will easily get a larger response. We strongly suggest you start with

Method # 1 and add METHOD # 2 as you go along.

For every $5 you receive, all you must do is e-mail them the Report they ordered. That's it. Always provide same day service on all orders. This will guarantee that the e-mail they send out, with your email address on it, will be prompt because they can not advertise until they receive the report.

===AVAILABLE REPORTS ===

ORDER EACH REPORT BY ITS NUMBER & NAME ONLY.

REMEMBER: YOU MUST ENTER THEIR EMAIL ADDRESS UNDER THE SEND MONEY NOW OPTION IN PAYPAL.

PLACE YOUR ORDER FOR THESE REPORTS NOW :

REPORT #1 "The Insider's Guide to Advertising for Free on the Internet"
ORDER REPORT #1 FROM:

threeredcords@yahoo.com

REPORT #2 "The Insider's Guide to Sending Bulk E-mail on the Internet"

How high is the rocket going ? If you are running 1 watt of power, then
the rocket will be in view of the ground station ? then just about anything
you do will be good enough for a transmitting antenna. Try insulating
(electrically) the transmitter from the body of the rocket and feeding the
output of the transmitter directly to the body of the rocket.
Seems that you are over engineering a simple system.

OK, the answer is that if the conjugate mirror involves RF
waves, as it does in "Reflections", you would see nothing.

2485. 300 ohm TV Twinlead

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-13 13:08:47 UTC
From: Buck <iam@this.site>
Message-ID: <jl6981tqn46d2nf21g3jqhmlbgm89emnbr@4ax.com>
Source record: 77350

I am considering making an HF antenna out of 300 ohm TV twinlead. I am thinking of making an OCF or CF dipole and using an MFJ-941 tuner to tune it to the various ham bands. I will be using an IC-706 MKII which transmits from 5 to 100 watts output.

Here are a few questions:

How much power can the twin-lead handle?
Radio shack has both the old thin twin-lead as well as the low-loss foam version. I realize that the low-loss will be better for the feed line portion, does it make a difference in the antenna portion?

Since the antenna tuner has a balun in it, I won't be using a balun. The purpose of the antenna will be to keep it in the car and to set it up for portable operations on occasions. When practical to do so, I may leave one of these antennas in locations where I visit frequently and wish to operate.

Thank you for your comments.

Hi Buck, this brings back memories, when I was a Novice, the first antenna I ever put up was made of 300 ohm TV line. It was a dipole made up of two 50' lengths of twin lead. The ends were shorted together, and a 1' length of 1 conductor was removed 16' from the far end of each section. I fed it with ~70 ohm twin lead (lamp cord). What you wound up with was a sort of fan dipole, that was resonant on 80, 40 and 15m. The 80m part was 50' + 16' folded back for a 132' 80m dipole. The other conductor was 33', for a 66' dipole which is 1/2 wave on 40m and 3/2 on 15m. I chose this design and materials because I was 14 at the time and this was all I could get my hands on. I worked stations all over the country on 80 and 40 with 15 watts cw. Only had 2 crystals.
I never checked the swr because I had no way to do so, but all the transmitters I used had pi network outputs, that would load most anything. When I got my General I ran 100 watts AM with this antenna with no problems.
I would go with the least expensive RS twin lead, should handle the power, and do fine as the radiator and transmission line.

If you make a folded dipole to match your 300 ohm feedline impedance then you should use the low-loss. If you're just going to short the wires together and treat it as one fat wire then use any old thing.

JS> it is swimming in it, is it not? And, if so, kinda strange no formula
JS> takes that into account, right?

Yes there is but the average net result of this energy is always zero.
However, it can be detected as the Casimir Effect, Lamb Shift, and Van
de Waals Forces which arise from the random motions of electrons. Some
people have even described this effect as responsible for Dark Energy
or Zero Point Energy, Fermi Sea, Quantum Ocean, or whatever
descriptive term you like best. Some have speculated it is also
responsible for the observed accelerating expansion of the universe.

Some explanations--

Lamb Shift:

" The effect of virtual particles can be measured, and in fact won a
nobel prize for the physicist who did. the lamb shift is the shift
in the spectrum of an electron around a nucleus caused by virtual
particles swarming around it.
"

Casimir Effect:

"
The following comes from the Usenet Physics FAQ
(http://math.ucr.edu/home/baez/physics/faq.html) and includes some
references:

Original by Philip Gibbs 24-January-1997

What is the Casimir Effect?

The Casimir effect is a small attractive force which acts between two close parallel uncharged conducting plates. It is due to quantum vacuum fluctuations of the electromagnetic field.

The effect was predicted by the Dutch physicist Hendrick Casimir in 1948. According to the quantum theory, the vacuum contains virtual particles which are in a continuous state of fluctuation (see physics FAQ article on virtual particles). Casimir realized that between two plates, only those virtual photons whose wavelengths fit a whole number of times into the gap should be counted when calculating the vacuum energy. The energy density decreases as the plates are moved closer which implies there is a small force drawing them together.

The attractive Casimir force between two plates of area A separated by a distance a can be calculated to be,

$$F = \frac{\pi^2 \hbar c}{240\, a^4} A$$

where h-bar is Planck's constant over two pi and c is the speed of light.

The tiny force was measured in 1996 by Steven Lamoreaux. His results were in agreement with the theory to within the experimental uncertainty of 5%.

Particles other than the photon also contribute a small effect but only the photon force is measurable. All Bosons such as photons produce an attractive Casimir force while Fermions make a repulsive contribution. If electromagnetism was supersymmetric there would be fermionic photinos whose contribution would exactly cancel that of the photons and there would be no Casimir effect. The fact that the Casimir effect exists shows that if supersymmetry exists in nature it must be a broken symmetry.

According to the theory the total zero point energy in the vacuum is infinite when summed over all the possible photon modes. The Casimir effect comes from a difference of energies in which the infinities cancel. The energy of the vacuum is a puzzle in theories of quantum gravity since it should act gravitationally and produce a large cosmological constant which would cause space-time to curl up. The solution to the inconsistency is expected to be found in a theory of quantum gravity.

A slot antenna obviates all the kludges your proposing.

Has to do with the spinning of this marble we live on. At the equator which direction does the water rotate.?

It also affects the whorrels in your hair pattern and the directions beans grow up a stick. What happens to pole beans at the equator?

The Trevor Marshall BiQuad is the most referenced feed for a dish.
http://martybugs.net/wireless/biquad/ refers to Trevor's site, and has
better instructions and pictures.

Paul wrote:
"The rocket body is a 12 inch diameter aluminum tube."

The tube could be slotted lengthwise and the gap insulated to make a slot antenna. Low profile can minimize atmospheric drag.

Look at page 320 of Kraus` 3rd edition of "Antennas". On page 321 Kraus writes:
"Typical slotted cylinder dimensions for resonance are D= 0.125 WL, L=0.75 WL, and the slot width about 0.02 WL."

12 inches, the rocket tube diameter, is 30.48 cm. If this is 1/8 WL, the WL= 2.438 m and F=123 MHz.

The length of the slot is 0.75x2.438=1.83 meters. Slot width is 0.02x2.438m=4.9 cm.

The length od the slotted cylinder is greater than 1/2-wavelength as needed for resonance because the cylinder circumference is not an infinite sheet.

Polarization is the same direction as the voltage across the slot, horizontal when the cylinder is erect. It has been used as an omnidirectional VHF broadcast antenna. The slotted cylinder can be scaled for any frequency.

Best regards, Richard Harrison, KB5WZI

Because human eyes cannot detect RF? :-)

A source impedance of 100+j100 ohms ensuring 100 volts
at the source output terminal to a load impedance of
100-j100 ohms through one wavelength of lossless 50 ohm
coax is conjugately matched.

A source impedance of 50 ohms ensuring 100 volts at
the source output terminal to a load impedance of 100-j100
ohms through one wavelength of lossless 50 ohm coax is
not conjugately matched.

All conditions of voltage, current, and power external to
the source output terminal are identical in both cases,
i.e. making only passive measurements, one cannot tell
the difference between a conjugate match and a mismatch.
Except for a minor effect on my power bill, I fail to see
what the hullabaloo (concerning conjugate matching) is
all about.

Called the "Coriolis Effect". In the Northern Hemisphere,
relative to the axis of rotation, points toward the north
move slower than points to the south. If we lived on a
cylinder rather than a sphere, we probably wouldn't have
any hurricanes.

Say, since math models seem to be able to dictate reality,
wouldn't a simple transformation from spherical coordinates
to cylindrical coordinates stop the hurricanes?

Oh yeah, everyone is familiar with that explaination, oxygen being slightly magnetic is responding to the earths magnetic field. And, being closer to one pole is more likely to spin in one direction--when closer to another pole the opposite... actually, I accept this--I didn't think anyone would miss it was being used as a "joke"... when you have to explain the jokes, it is just not the same... <frown>

Reg:

Yes, "wine" is another way in which you can run almost any windows
application (even windows itself--the operating system!!! on linux)...

But, if they can use a compiler, I notice you also have some source code on
your page... and they could also compile this directly on a linux system...

Here is a link to one compiler which can be used to compile borland
turbopascal souce directly on a linux (and unix) system--and you end up with
a linux executable as opposed to a windows executable...
http://www.musikwissenschaft.uni-mainz.de/~ag/tply/tply.html

I'm hoping to buy the third edition. The reason I asked is because the only thing I can find is something called a phase conjugate mirror, which has some really interesting behavior. And not exactly the behavior being discussed in this thread. Time reversal for example. For starters, check out:

http://www.optics.kth.se/fysik2/staff/pu/thesis/node7.html

I doubt Richard had considered all the possibilities when he said to elaborate would be redundant.

>DirectTV 20" dish, offset fed, f/d~0.7, to be used for 2.4 GHz wlan link.

Offset feed dishes have different f/D ratios depending on
polarization. I just did a quicky measurement of an RCA (Thomson)
dish which yields 0.67. Close enough.
http://www.qsl.net/n1bwt/app-5a.pdf

>As I understand the issues, the best feed is one that -- for a given focal
>length -- will "light" the dish with as spherical a wave as possible, that
>has a broad enough dispersion angle to fully "paint" the dish without picking
>up off-the-edge noise.

Exactly. See:
http://www.qsl.net/n1bwt/contents.htm
for how it works. Be sure to read chaper 6 on feeds.

>I've looked at all types of feeds, from cantennas to bi-quads to patch to
>dual-dipole. All have their pros and cons.

Biquad should work.
http://www.trevormarshall.com/biquad.htm
http://martybugs.net/wireless/biquad/
-3dB beamwidth of the biquad is about 60 degrees. Using a protractor
to eyeball my pizza dish, it wants a 70 degree angle. Close enough.

>I'd like to hear from anyone who has done this before about what feed they
>chose and why.

See:
http://www.weijand.nl/wifi/
Have fun aiming the dish.

Yes, I am quite in agreement, and these things are "real" without doubt (or the apparent affects/effects are.)

And, that is the crux of the matter, how to control and "orchestrate" these "things" for ones benefit (such as the difficulty faced when getting light coherent--or arranging iron/nickel/"rare earth" atoms in logical arrangements to achive great magnetism forces)--when all are not even aware or accepting--just getting a start can range from difficult to impossible...

Warmest regards,
John

| JS> Indeed, my antenna has a LOT of it, in its' metal, does it not? And,
| JS> it is swimming in it, is it not? And, if so, kinda strange no formula
| JS> takes that into account, right?
|
|
| Yes there is but the average net result of this energy is always zero.
| However, it can be detected as the Casimir Effect, Lamb Shift, and Van
| de Waals Forces which arise from the random motions of electrons. Some
| people have even described this effect as responsible for Dark Energy

| or Zero Point Energy, Fermi Sea, Quantum Ocean, or whatever
| descriptive term you like best. Some have speculated it is also
| responsible for the observed accelerating expansion of the universe.
|
| Some explanations--
|
| Lamb Shift:
|
| " The effect of virtual particles can be measured, and in fact won a
| nobel prize for the physicist who did. the lamb shift is the shift
| in the spectrum of an electron around a nucleus caused by virtual
| particles swarming around it.
| "
|
| Casimir Effect:
|
| "
| The following comes from the Usenet Physics FAQ
| (http://math.ucr.edu/home/baez/physics/faq.html) and includes some
| references:
|
| Original by Philip Gibbs 24-January-1997
|
| What is the Casimir Effect?
|
| The Casimir effect is a small attractive force which acts between
| two close parallel uncharged conducting plates. It is due to quantum
| vacuum fluctuations of the electromagnetic field.
|
| The effect was predicted by the Dutch physicist Hendrick Casimir in
| 1948. According to the quantum theory, the vacuum contains virtual
| particles which are in a continuous state of fluctuation (see
| physics FAQ article on virtual particles). Casimir realized that
| between two plates, only those virtual photons whose wavelengths fit
| a whole number of times into the gap should be counted when
| calculating the vacuum energy. The energy density decreases as the
| plates are moved closer which implies there is a small force drawing
| them together.
|
| The attractive Casimir force between two plates of area A separated
| by a distance a can be calculated to be,
|
| pi2 h-bar c
| F = ----------- A
| 240 a4
|
| where h-bar is Planck's constant over two pi and c is the speed of
| light.
|
| The tiny force was measured in 1996 by Steven Lamoreaux. His results

| were in agreement with the theory to within the experimental
| uncertainty of 5%.
|
| Particles other than the photon also contribute a small effect but
| only the photon force is measurable. All Bosons such as photons
| produce an attractive Casimir force while Fermions make a repulsive
| contribution. If electromagnetism was supersymmetric there would be
| fermionic photinos whose contribution would exactly cancel that of
| the photons and there would be no Casimir effect. The fact that the
| Casimir effect exists shows that if supersymmetry exists in nature
| it must be a broken symmetry.
|
| According to the theory the total zero point energy in the vacuum is
| infinite when summed over all the possible photon modes. The Casimir
| effect comes from a difference of energies in which the infinities
| cancel. The energy of the vacuum is a puzzle in theories of quantum
| gravity since it should act gravitationally and produce a large
| cosmological constant which would cause space-time to curl up. The
| solution to the inconsistency is expected to be found in a theory of
| quantum gravity.

2512. Jesus said, "I am the way, the truth and the life: no one can come to the Father(God)(in Heaven), but by me." (John 14:6) This means that if you die without trusting in Jesus Christ as your Lord and Saviour you will die in your sins and be forever separated from the love of God in a place called Hell. The Holy Bible descibes Hell as a place of eternal torment, suffering, pain and agony for all those who have rejected Jesus Christ. The good news is that you can be sure you are going to Heaven when this life is over if you allow Jesus Christ to save you today. Do not wait until later to be saved because you do not know exactly when you will die. [Posted by: RonaldGrossi3828@yahoo.com on May 13, 2005] [6:39:05 pm]

Hi Jim,

In the 18th century politics, someone who straddled the fence was
called a Mugwump - their mug on one side and their wump on the other.

>The reason I asked is because the
>only thing I can find is something called a phase conjugate mirror,

It was suitable enough, but rather slim.

>which has some really interesting behavior. And not exactly the
>behavior being discussed in this thread. Time reversal for example.

This issue of what "is" and "is not" behavior being discussed is
strictly a matter of interpretation. Insofar as discussion continues,
it is quite evidently what "is" being discussed (a tautology). After
all, how many could mistake a director from a reflector and after
discussion still emerge confused?

Hi Fred,

'xactly.

The apparently more complex question is the shorter one:
Why?

To that, there's been expansionist constructions of irrelevant
elaboration trying to equate the experience to a transmission line
(given the problems of understanding on that topic, it is amazing
anyone could claim to be sighted).

Hint: Appeals to math are inversely proportional to the sense of the
answer. The answer runs counter to the thoughts of the medievalists
(as some arguments tend to run in that vein, those adherents are thus
confounded) - which I will perhaps expand upon (to the consternation
of those who stand in horror of things Shakespearian) later.

I think you should ask the person who made the comment.

It wouldn't be surprising if some 4:1 baluns have a loss of a dB or so at some impedance levels. It's very unlikely that a 1:1 balun would have this much loss. The questions are:

1. Why does the person you quote think that the tuner will have less loss when confronted by the different impedance than the balun had? It's entirely possible that the tuner's loss will increase (or decrease) by a dB or more when confronted by the different impedance presented when the balun is removed. Has he done an analysis or made careful measurements to confirm that he's actually reducing overall loss with the change?
2. Is the person you quote willing to accept the effects of common mode current on his feedline which could result from removing the balun? (See http://eznec.com/Amateur/Articles/Baluns.pdf.) One likely effect is that the signal radiated in the desired direction will change due to feedline radiation. Has he determined that he'll benefit from this by more than one dB?
3. Does the person you quoted really think he'll be able to detect a 1 dB improvement?

Roy Lewallen, W7EL

I can remember as a child finding "dust bunnies" under my bed--I considered, for the longest time, if this were not proof of the "boogieman" (NOT to be confused with his disco counterpart) and were the "leavings" of this mythical being...

They were not, this was the radomness of nature at work, forming balls and threads out of various fibers, both natural and manmade--and dust--in conjunction with air currents--mainly...

But, what I did see, I have seen again thoughout my life--patterns of "nature" at work--always random--always a degrading of "planned structures", NEVER building a surprising structure which can be confused with one a thinking mind constructs from logical design....

From this, it is easy for me to draw the conclusion that we are not the result of "intelligent-randomness" at work... to me that is quite obivious, and until new and startling evidence is uncovered--I shall remain so, and unbelieving in such--others may view all of this and decide different... I have listened to their arguments of why they do and have believed so--all still leave me with the same blank look upon my face...

I remain listening...

"... the truth is out there...", X-FILES "theme"...

Warmest regards,
John

Way back when this thread was living, Ed apologized if anyone misunderstood his tongue in cheek comments. If this was a group that was limited to PhD's of EE who had all been Chief Broadcast Engineers at major facilities, then the members could all pretend to be equal (which of course they still wouldn't be). But this newsgroup is not that, and neither does its name imply the lowest level of competence in the field. If you have such a problem with standards, perhaps your moniker Flannery O'Conner has not been a good teacher, as you have missed one of the defining marks of a man; to have high standards. Without them, whatever happens is fine, and a wicked place that will be, besides the dumbing down that results from whining about achievement being more highly valued than mere existence.

Is anybody on this newsgroup using the new (Indian) Hamsat? I've been listening to it while mobile with an M^2 Ho Loop antenna and hear it quite well. Haven't tried to uplink through it yet. Would a linear Yagi on each band be OK? There isn't much info on this new bird yet. Just wondering if it is using circular polarization or linear or what. I would like to try a QSO through it for Field Day. Maybe a regular old Yagi (or Quagi since I have one for 432) mounted on a makeshift az-el setup and put the 2M and 70 cm antennas at right angles to each other to cut down on the 432 getting to the 2M receiver and overloading it? Ideas???

2531. High Impedance Feedlines = Lower Loss - Why ?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-14 04:10:31 UTC
From: Gary
Message-ID: <8gta819f9hoec40cq9cr71sjenlckeqj3k@4ax.com>
Source record: 77296

I've read for years (and never asked why) that when you're operating into a high SWR that a high impedance feedline (say 450 Ohm ladder line VS 52 Ohm coax) provides much less loss. I think I recall someone in this group saying that its mostly current losses. Does the high impedance line have higher voltage points across its length and therefore less current flow for a give power level (say 100 watts) than the 52 Ohm coax ?

I guess an analogy if the above is true could be made about the 120Kv + power lines on tall steel towers that are about 500 feet behind my shack. (Lucky me !) They have much less loss than trying to run say 120 volts and all the current flow that would entail for the same wattage delivered to homes, business etc ? I can imagine the size of the conductors required to deliver the same amount of wattage at 120V VS 120 Kv +/-.

Thanks .... Gary

The Z0 of a feedline forces the ratio of forward voltage to forward
current to be Z0. It also forces the ratio of reflected voltage to
reflected voltage to be Z0. Let's say we have 100 watts forward and
50 watts reflected on both 450 ohm feedline and 52 ohm coax. The
forward voltage on the 450 ohm feedline is SQRT(100*450). The forward
current on the 450 ohm feedline is SQRT(100/450). The forward voltage
on the 52 ohm coax is SQRT(100*52). The forward current on the 52 ohm
coax is SQRT(100/52). The same pattern holds for reflected signals.
The effect of Z0 on voltage and current is easy to see.

Gary:

This question is out of my league, suspect Roy will be able to answer with no problem--probably a lot of the others too...

However, in my expermenting, I have adusted the match at an antenna fed with 300 twin lead (causing a high SWR) while watching Field Strength on a meter which was positioned so it could only "see" a good section of the feedline... you could watch radiation from the feedline go up with SWR--I cringe when they say coax has even more "loss"--or perhaps this is not the "loss" you mean...

Warmest regards,
John

Thanks Cecil ! In your example it appears that the coax is carrying
about 3 times the current of the 450 Ohm ladder line. That explains a
lot.

Sigh, what an illiterate group.

From John Donne (OK, after Shakespeare):
"Our eye-beams twisted, and did thread
Our eyes upon one double string."
suitable for the twin lead metaphor.

(howzaboutthat, another association between poesy and RF) The
appearance of the hand sign of the forefinger and little finger held
up with a closed fist is associated with this couplet that further
hints to the solution of "Why?"

The explicit hint is: evil eye (Friday the 13th?).

Thanks for the reply and example John. I was referring to the loss in power when operating into a high SWR with coax VS a high impedance line like twinlead / ladder line / open wire. Someone in a post here mentioned it was mainly current losses and that piqued my interest. Cecil answered my question and gave me the formula. In his example the coax was carrying about 3 times the current of the 450 Ohm ladder line, which explains it.

You will get all sorts of technical reasons for lower loss. But
essentially -

The wires in high impedance balanced pair lines are thicker than the
inner conductor of coaxial lines.

Thicker wires mean lower resistance.

Lower resistance means lower loss.

Hey Folks,
Kinda down at the moment, our college radio station got busted by the FCC. Here a list of the stuff that was hauled off:

NRG PLL-PRO 3 20W TRANSMITTER
NRG 220 WATT RF LINEAR AMPLIFIER
NRG PRO III STEREO CODER
NRG PRO III STEREO LIMITER COMPRESSOR
DAIWA CN-101L SWR+POWER METER
COMET CFM-95SL 5/8 WAVE ANTENNA
50 FEET OF LMR 400 COAX
KENWOOD R-1000 SW RECEIVER (my fathers old short-wave radio?)

The really weird part is that we WERE NOT transmitting at the time of the raid. One of the agents tolds us that they traced us through a purchase order from Broadcast-Warehouse! It's true that we bought a 150w amp from broadcastwarehouse.com a few weeks ago. How did the FCC know about that?

Anyways, we will rebuild the station and continue to fight the globle interests of the MEGA-MACHINE.

DEATH TO THE MEGA-MACHINE!

2545. dipole center space?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-14 11:46:59 UTC
From: ml <m@di.net>
Message-ID: <m-E72189.07465314052005@news.verizon.net>
Source record: 77310

hi

i was wondering , currently my dipole is fed via a 5ft section of 450ohm ladderline. it goes up a pvc mast that i have 2 eye bolts on the top of ...

i've spaced the eyebots such that they are about the same space as the latter line conductors , and my dipole wires attach to the eye bolts

in different dipole constructions i've often noted that this center spacing is often at different gaps, typically larger(coiencidentally).

so if m spacing was say larger (now i have other than 450 ohm feed i'd guess

what happens

so my ladder is 450 ohm if my gap is say 2"(think thats 600ohm?) how does the ohms add"" up

and does this typically increase /decrease loss (antenna/and feedline)

does it alter resonance

does the voltage/current nodes move out?

i got mixed up

thanks

2546. Re: Jesus said, "I am the way, the truth and the life: no one can come to the Father(God)(in Heaven), but by me." (John 14:6) This means that if you die without trusting in Jesus Christ as your Lord and Saviour you will die in your sins and be forever separated from the love of God in a place called Hell. The Holy Bible descibes Hell as a place of eternal torment, suffering, pain and agony for all those who have rejected Jesus Christ. The good news is that you can be sure you are going to Heaven when this life is over if you allow Jesus Christ to save you today. Do not wait until later to be saved because you do not know exactly when you will die. [Posted by: RonaldGrossi3828@yahoo.com on May 13, 2005] [6:39:05 pm]

yes, the spread in the center insulator does affect the resonance and
current distribution and match and all that stuff... but for typical spacing
changes on hf the effect is small enough that you can normally ignore it.
might as well worry about the effect of capacitance between the larger
conductor of the bolts vs the wire if you are going to worry about the small
spacing change.

Whoa Lenny, this is so old you must have been buried really deep! (In what,
I have no idea.)

Maybe I'm using too many big words for you, but I doubt it. You really seem
to have a problem with social interaction, but this group isn't the proper
forum to resolve those issues. However, I'll recap the situation, and maybe
you might be able to sort out your feelings along the way.

The thread had been talking about understanding RF propagation and the
concept of interference. Now, if you brought that subject up to 100 random
people on the street, would you expect them all to be "equals"? If that same
question were posed in an "antennas" group, would you have an expectation
that these people would be slightly more informed about the subject? How
about if you posed that question to a group of hams (people who have
voluntarily sought out a technical hobby and who have even passed
examinations on the technical content of that endeavor)?

It should be clear that, while it's nice to be courteous, we are not all
equals. BTW, my dog doesn't think you're her equal either, although she does
concede to recognize you to the extent that she has blocked your address on
her email account. Hey, what can I say, the dog has high standards.

I'm sorry to hear about all the people you have to "put up with." But as
Sgt. Stryker once said, "Life is tough; it's even tougher when you're
stupid."

Yep, just noticed a typo above where "voltage" should have been
"current" above. Hope that was obvious. The ratio of the current
between 50 ohm coax and 450 ohm ladder-line is indeed 3 to 1 *FOR
EQUAL SWRs*.

Taking it to the next level of understanding, what if the SWRs are
not equal? Let's say we have 50 ohm coax and a 50 ohm load. The
system is matched and current flows only one way. Total current
for 100 watts equals SQRT(100/50) = 1.414 amps.

Now let's feed the 50 ohm load with 450 ohm ladder-line. The SWR
will be 9:1. Forward power is 278 watts and reflected power is
178 watts. Forward current is SQRT(278/450) = 0.79 amps. Reflected
current is SQRT(178/450) = 0.63 amps. Both of those currents cause
total I^2*R losses roughly equivalent to their sum. Their sum is
1.414 amps, the same as the forward current in the matched coax.

So the losses in 50 ohm coax and 450 ohm ladder-line are roughly
equivalent using similar size wire and driving a 50 ohm load.

I'll leave it as an exercise as to what happens when 50 ohm coax
vs 450 ohm ladder-line is used to drive a 450 ohm load.

Remember, that is for the *SAME SWR*. When the SWRs are different,
as they will be for a fixed load, that loss ratio figure will vary
away from 3 to 1.

That is true. But the number one reason that matched line loss
for 450 ohm ladder-line is lower than matched line loss for RG-213
at HF is the effect of (characteristic impedance = load) which is
the same effect as Ohm's law.

Given RG-213 vs 450 ohm ladder-line the losses are *roughly*
equal when:

SWR(coax)/50 = SWR(ladder-line)/450

or, in general, when:

SWR1/Z01 = SWR2/Z02

2558. Re: High Impedance Feedlines = Lower Loss - Why ?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-14 16:12:06 UTC
From: richardharrison@webtv.net
Message-ID: <27878-42862356-8@storefull-3257.bay.webtv.net>
Source record: 77322

The main reason a high impedance feedline equals lower loss is that the resistance in the feedline is the main loser. Its loss is current squared times the total resistance. The same power can be conveyed as a high voltage and a low current (high impedance), or as a low voltage and a high current (low impedance).

When conveyed as a high current and a low voltage, the power extracted by resistance is higher for a given power conveyence. Powerline voltages are often limited by flashover voltage. That`s a reason for d-c high-voltage power transmission. D-C is at peak value all of the time, and needs to be insulated for no higher voltage. Maximum voltage means minimum current for a given power. Ciurrent squared times the resistance is lowest too.

Loss increases with line length for a particular cross section. A rule-of-thumb for powerlines is that your transmission voltage should be 1000 volts per mile the energy is to be transported.

Power is volts x amps x cos theta. Cos theta is the power factor which should be 1 to minimize total current (zero reactive current). Impedance of the line is volts / amps.

Best regards, Richard Harrison, KB5WZI

Cecil:

Wait, before you place me on the other side of the fence and portray me as arguing against this--it is obvious that we cannot know--at this point in gathering "proofs."

It is equally obvious at this point that some have just quit looking. Simply choosing to believe one religion or another, i.e. "God" vs. "Evolution"--for an example...

Also, it appears that most things you can find a model for, you can eventually find an explanation/solution for... if such an example exists, it needs to be examined... life on earth is but one example--if we could find but one other like "thing" we could begin finding common properties... but when there seems only one, and no clear models on how it happened--the problem is immensely more difficult to solve...

And, I believe it is true, "nature" only demonstrates destructive forces and "clumping"--drawing matter together into spheres--brought about by the law of gravity (and what is gravity--if not a "warping" of the ether?)... while this ability to be "God" and create life may well be within her powers (natures'), she is loath to demonstrate it openly and abundantly...

And, frankly the evolutionists worry me--if they listen closely to what they are saying--they will hear they are arguing for the existence of aliens--I doubt if it possible evolution could have only happened on Earth... some worry about individuals with a belief in aliens... now if you define evolution only as "change", of course that is quite possible--and examples exist in abundance and is a property of nature which she demonstrates constantly and consistantly... it is that "spark of life" which stands so singularly perplexing...

Now, having said that... I just don't know, more questions than answers... I would like to see more evidence found and discussed... but, you see what I see, most are just ready to "kill" to defend what beliefs they have chosen... strange to say the least...

Warmest regards,
John

2560. solder vs clamps

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-14 17:21:39 UTC
From: ml <m@di.net>
Message-ID: <m-94B27F.13213314052005@news.verizon.net>
Source record: 77324

my dipole (center) has the usual wire thru a eye bolt and wrapped around itself like the arrl manual typically shows

my ladder line transitions to the wire itself and is also wrapped around

questions:

rather than soldering it, (thought it might be stiff and break??) i used proper sized wire clamps(w/teeth) [two of them , torqued proper]

wonder if a good compression fit is ok, or if eventually corrosion will make for a poor connection?

it's still new enough i could clen it and solder it

any thoughts? perhaps it's just trivial but i wonder hate to throw off harmonics

Compression fit is generally good for stranded, deadly for a
moving solid. Bright side: "Eventually" you won't care. :-)

2563. Randomwire .vs. Endfed Windom

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-14 18:41:18 UTC
From: GeorgeF <av8tor@licensed4funREMOVEBEFOREFLIGHT.com>
Message-ID: <iDrhe.1298$w21.610@newsread3.news.atl.earthlink.net>
Source record: 77227

I am currently using a 150' randomwire for 80 & 40 meters. Its connected to the "wire" terminal of an MFJ-949 tuner. Been happy so far with the conntacts made.

I'm considering taking an turning it into an endfeed windom simply by running 450 ohm ladder line from the MFJ-949 to the top of my 30' mast which current supports the randomwire. I'll be cutting the randomwire at the mast and soldering one side of the 450 line while letting the otherside of the 450 line not attached to anything.

Is there any advantage of doing this? Basically I'm taking a 150' randomwire and turning it into about a 120' endfeed windom, will it be worth the effort?

George

In the mirror? Human beings are fractals. In particular,
you look a lot like a Mandelbrot character and your ribs
and backbone resemble cloud formations. Why do you think
we see images in clouds?

I made a minor mathematical blunder when I tried to generate
the fractal Madelbrot set for the first time. That mistake added
arms, legs, ears, and reproductive organs to the Mandelbrot character.
Mother Nature apparently made the same "mistake". Fractal math and chaos
rule evolution with an iron fist. Of course, you would say we have
simply discovered God's math and you could certainly convince me that
we are dealing with an absolutely insane God. :-)

How about an explanation of why God would create conjoined (Siamese)
twins? That's on TV right now. Do conjoined twins with one brain and two
bodies have two souls or one? Do conjoined twins with one body and two
heads have two souls or one? What is God's logic in creating conjoined
twins? - an insane morbid sense of humor?

That's a rather ignorant statement? Do you believe in cells? Virus?
The universe is an incredibly vast place and just because we currently
lack the means to see the microbial life that might exist on planets
thousands of light years away doesn't mean they might not exist. Now,
I know, from the imbecillic religious mind, you want to use this to
assert that God exists, but hang on a sec. Here's the crazy thing about
science. There's this thing called 'The Scientific Method'. It's not
always perfect, but it's not bound by dogma. Theories can be tested,
retested, and credited or discredited. The key thing about science is
that results are predictable and reproducible and, often, several different
methods can be used to achieve the same proof. God completely fails in
this. You have only one 'theory'. There is no way to test it, there
is, at best annecdotal evidence, and none of the data is repeatable.

We can detect small variations in the position of stars that can only
be described by the motion of another massive body interacting with
them. We can also detect variations in the light coming from the
star which match the motion. Both of these give us strong evidence
of a massive non-star object orbiting the star. The more sophisticated
our sensors become, the more of these objects we're spotting and the
smaller the objects we detect. There are TRILLIONS of stars out there.
It's an inconcievably huge number. In our solar system alone, we have
Venus, Earth, Mars, Jupiter, IO, Europa, Saturn, Titan, Neptune, and
Uranus which show activity of physical and chemical activity taking
place. We have set foot on and closely examined soil samples on
ONE of these TEN bodies. 2 of the 10 have potential for evidence of
current or past life similar to our own, and that's not even

counting the potential for say... Silicon-based life-forms or
germanium, or who knows what else.

Well, your questions are interesting, I am sure you mean to point something else out, but I hear: "What is this "God's" logic in creating conjoined twins? - an insane morbid sense of humor?"...

--AS--

..."What is this "God" about, has he no sense of decency?--has he no respect for the designs of men, their logic, purposes, expectations and goals?"

To know the mind of "God" may not please us... it is quite possible "God" is insane--if so, it may be a longtime before a sane replacement is found...

Indeed, almost all points of view I hear today would design "God" in our image, using our logic, and not the way it has really (and already) been done--and is one of the reasons I have more questions than answers--one being, "Are we even sane enough to be able to handle these tasks and seek these answers?"

Most even refuse to believe a power greater than us is our master, and so, travel about seeking the "one" to control and punish and bend to their wills--perhaps, a grave mistake... would it be easier to accept if the "Mud Puddle God" of "Evolution" is responsible for this design--is the human condition so much more easy to accept if this is the case? Would it be "OK" then?

As to "us", well, we are POSITIVE proof it has been done--but no proof of "who" has done it, how it has been done, or even why it has been done... but, we should keep searching... an answer may be found...

However, often I wonder if all of this isn't really just in my mind--you are all not real, and I just imagine these conversations to amuse myself... To search to find out if "God" is real or not, without even first having decided about all of you is a bit insane in itself... I have had dreams and carried on elaborate conversations with the likes of you (or one such as you)--and then woke up!!!! In at least one dream I have "pinched myself", not wokeup and accepted this as proof positive I was not dreaming!!! A great error!

Let's face it, it takes a leap of faith for me even to believe in you... I am pinching myself now, as we chat...

Warmest regards,
John

Cec,

With this sort of argument you must not compare one manufacturer's
cable with another. You can't believe the sales-talk anyway

Why unnecessaily complicate the question? Why introduce standing
waves and reflections and all the other silly time wasting
distractions?

The number one reason for attenuation being higher is because the
conductor diameter is smaller and, as a consequence, its resistance is
higher.

The exact simple mathematical relationship is -

Line attenuation = 8.69*R/2/Ro dB.

Where R is the resistance of the wire and Ro is the real component of
line impedance, all in ohms.

Make a note of it in your notebooks.

And, hopefully, that should be the end of the matter. But, knowing
you lot, it probably won't be. ;o)

Reg, G4FGQ

But the number one reason that matched line loss
> for 450 ohm ladder-line is lower than matched line loss for RG-213

Dave,

Yes, it would be much easier for you and the rest of the crowd.

But it would occupy thousands of hours of hard work for me. And
there's not that much remaining time. In any case the job would be
unpaid. Unless, of course, you would like to organise a rich charity
on my behalf.

My working days are over. I would much prefer to spend my time
writing new programs. It's a far more satisfying hobby. ;o) ;o)

Dear Reg,

Can we also assume that your formula is for "matched line" attenuation
only, and that the attentuation for a given line will actually
increase with SWR?

Is skin effect accounted for in your equation? For example at 10MHz, skin effect confines most of the current to the outer ~21 ï¿½m of the conductor.

Okay, can you guys set me straight on a few things?

I'm supposed to feel something for Jesus because He died for my sins, but at the same time He also DIDN'T die but ascended to Heaven and is everlsting and eternal. Could we please clarify what emotion I'm supposed to have for the dead/not dead Jesus and why this sacrifice, which was undone and clearly improved his situation, is important?

God *gave* His son, but got him back after three days--a nanosecond in Godlike time, to say the least. How am I supposed to view this loss, when the loss was undone almost immediately?

If mortal life, as I am consistently told by the clerics of the Christian faith, is not as important as eternal life, what emotion am I supposed to feel about Jesus giving up His mortal life for my benefit and going on to His eternal life, which I will not achieve unless I acknowledge the importance of his non-important, non-tragic, non-sacrifice?

If God is all-knowing, all-seeing, all-doing, hasn't He already decided whether or not I'm going to Heaven? Because if I can *choose* something God *doesn't want*, that makes me more powerful than God.

Throw me a bone here, people...

> higher.

On that we can disagree. The *number one* reason for attenuation being higher is because, in a matched feedline, the losses are proportional to the square of the current, and the current is inversely proportional to the characteristic impedance of the feedline, i.e. given #20 wire, a Zo-matched 75 ohm feedline will have Sqrt(600/75) times the I^2*R losses of a matched 75 ohm feedline. Proof:

SQRT(100w/75) = SQRT(600/75)*SQRT(100w/600)

SQRT(100w/75)/SQRT(600/75) = SQRT(100w/600)

100w/600 = 100w/600

Given that the center conductor of RG-213 is the same size wire as a parallel feedline, a *very* large percentage of the difference in matched line dissipation is due to the Z0. (I don't know the size of the center wire in RG-213 but it looks like #14 or #12.) I don't think the RG-213 center conductor is at all smaller.

<sigh>

Okay, here's the rundown, according to modern theology.

During His time on Earth, Jesus was born, lived and died like any ordinary person. Yes, He worked miracles; we could work the same miracles, with enough faith. He didn't do anything a human couldn't possibly do... until He died.

After He died, it was time for the reckoning. Because He was being used as a "scapegoat" for the world's sins, He couldn't go straight to Heaven. First, He had to descend into Hell and receive the appropriate punishment for the load of sin He was carrying. Because He accepted the sin-debt voluntarily, His punishment time was shortened. It was at this time, according to some versions, that He performed the "Harrowing of Hell"; finding people who had been punished enough and releasing them to ascend to Heaven. Likewise, He is said to have released all those who were in Hell simply for not following God, as He was paying for them, too.

At the end of the three days (Earth time; remember the "one day... is as a thousand years" line), He appeared back on Earth, His duties discharged. After appearing to His apostles, He then ascended into Heaven.

Keep those three days in mind: Since Jesus had to live as any other soul, He experienced approximately 3,000 years of torment before being released. Slightly less, if we allow time for the Harrowing, but still an impressive figure.

Does that help?

Yours truly,

The explanatory,

>

For the benefit of those who don't killfile anyone who disagrees with them, allow me to rebut.

Samantha's first two plaints make no sense in light of the "theory" in question, i.e. that God created the Universe. Nobody has ever created a means of testing the creation process, so we can't test the Big Bang, either. We can look at the background radiation, the distribution of material, the age of the stars, etc., and say, "It looks as though the Big Bang is a correct and adequate theory". The Big Bang cannot be tested, however: It cannot be reproduced in the laboratory, we don't have any concepts to answer questions about its beginnings (What made the Big Bang, Was the Big Bang caused by ZPE, and so on), and it begs the same ontological question as God: What came before it, if anything?

Likewise the "anecdotal evidence" problem, on which grounds we should throw out all theoretical physics. After all, we can't find muons and gluons; we just "figure" they're there because it fits the theory. We think we saw a muon once, in an experiment nobody's been able to repeat... would Samantha hold that muons and gluons are religious "nonsense"?

As for none of the data being repeatable, that depends on what "data" you mean. If you mean making the Earth in seven days, parting the Red Sea, etc., then Samantha's right; we have no way of duplicating it. Apparently she's not willing to allow the commonality of near-death experiences, and would likely deride anyone who had one as insane, so I'll skip over those thousands upon thousands. She would likewise toss guardian angels upon the theoretical scrap heap as well; most likely dismissing them as some sort of ego-boosting hallucination (though why anyone thinks you get an ego-boo out of being grabbed up and moved like a game piece is beyond me. It's *scary*!). The fact is, however, that we've managed to verify some parts of the Bible: The parting of the Red Sea (complete with the reason for the "breath from his nostrils" comment) actually happened, though the drowning of the Egyptian army appears to have been a mistranslation. Modern humanity really does date back to a single female geneline in the neighborhood of

Africa (the Eve theory) according to the mitochondrial DNA. So it's not like the Bible is completely inaccurate.

Of course, Samantha hides from new ideas ("The light! It burnses!"), so she'll never see this. Oh, well.

Yours wolfishly,

The bemused,

Wanderer

Regarding VSWR:
I would think that increase in effective current does cause greater (I*I)*R losses (ohmic)...

... also, an effective increase in voltage also causes increased (E*E)/R losses in the dielectric itself...

But, what kinda of losses are we talking with both these, under 1db? (no irate flames, please)

| I've read for years (and never asked why) that when you're operating
| into a high SWR that a high impedance feedline (say 450 Ohm ladder
| line VS 52 Ohm coax) provides much less loss. I think I recall
| someone in this group saying that its mostly current losses. Does the
| high impedance line have higher voltage points across its length and
| therefore less current flow for a give power level (say 100 watts)
| than the 52 Ohm coax ?
|
| I guess an analogy if the above is true could be made about the 120Kv
| + power lines on tall steel towers that are about 500 feet behind my
| shack. (Lucky me !) They have much less loss than trying to run say
| 120 volts and all the current flow that would entail for the same
| wattage delivered to homes, business etc ? I can imagine the size of
| the conductors required to deliver the same amount of wattage at 120V
| VS 120 Kv +/-.
|
| Thanks .... Gary

More and more fundamentalist spam. The following isn't theology,
it's superstition. It also has no business being on a newsgroup
devoted to antennas. I suppose this is some Fundie's idea of spreading
the gospel, like the recent "trial" of evolution in Kansas. The only
thing it really spreads is irritation, and the marvel that some people,
who pretend to be humans, can sink to the level of ignorance
demonstrated by this post.

Radio Shack is a convenience store for electronics, selling mainly consumer electronics like cell phones and stereos. Components are a side line. I buy stuff like wall warts from Mouser or Allied and get exactly what I want, or better, find them at surplus stores for pennies on the dollar/cents on the euro.

I can imagine a major event striking the earth, killing most, and reducing us to sheer survival state... writing, math, art, science swept away with the crash of a giant asteroid...

and, if I existed far in the future... I might read something in some old book claimed to have come from ancient times, which just might read:

... and in those times there where men who used metal boxes (radios?) to talk, not only to other such men on earth at great distances, but to men who lived in space (space station--astronauts?)...

... they errected structures in the sky of metal (antennas?) and metal rope (coax?), these ropes tied the structres to the boxes...

... a device (mike?) hooked by a thin rope (mike cord?) was held before ones face to be spoken to... ... this voice then floated out accoss the ether to those in distant lands and craft which floated in the heavens...

... and it would be just as hard to understand as the bible is today...

Warmest regards,
John

Split bolts are used by electricians.
If you are concerned about corrosion, wrap the joint with good electrical
tape (rated for outdoor usage - UV and temperature range) - some power
companies do this for outdoor connections subject to corrosion, etc.

Actually the product of the standard deviations of position and momentum is
>1/2h, where h is Planck's constant.
The original derivation is due to Gauss:
If we have two functions G and H which are conjugate Fourier transforms of
one another, FG=H and FH=G,
then the product of their standard deviations is > 1/2.
Heisenberg realized that position and momentum satisfy that criterion.

73, H.

There is a two-component epoxy putty, I have used this to water-proof/weather-proof different kludges of mine--even to construct standoff, insulators and unique hardware bits... my latest stash came from the 99-cent store... "bondo" can also be used from autosupply stores (used to fill dents in auto bodies) with good success (strength is somewhat less)...

Calling Evolution a religion is simply incorrect. I "believe" in
evolution, by virtue of the preponderance of evidence, and the
connection with so many other "facts" of the physical world as we know
it now. But I do not pray to evolution, I do not go to an evolution
church or go through some ceremony to prove to the world that I am an
evolutionist - whatever an evolutionist is....

Check out the connections. If evolution is "wrong" or does not exist,
then indeed, most physics "facts" are not facts at all, they are dead

wrong. Not only is evolution wrong, but radioactive decay is wrong, etc, etc, etc.

> As to "us", well, we are POSITIVE proof it has been done--but no proof of
> "who" has done it, how it has been done, or even why it has been done...

If you believe in it because of "virtue of the preponderance of evidence" it shows you easily confuse "leap of faith" with "positive proof."

You know, "time" may just prove you correct...

At some distant time in the future, when some horse lover goes out to the
barn to saddle up and take a ride--and is suddenly shocked his/her horse has
"evolved" and now deserves a new scientific classification all its own...
we will know...

But, more likely what will have happened, is in a lab somewhere a "thinking
mind" has constructed the new animal... a quick look at the calendar, at
that time, will show it is indeed April First!!!

Warmest regards,
John

You can certainly use an end-fed Zepp on other bands but
it won't be a Zepp on those other bands. The definition of
a Zepp is 1/2WL long end-fed with 1/4WL open-wire feedline.

Well, I already apologized for sounding stuffy, but I can do it again. I'll probably commit that offense again some time, so I better keep my apologizing muscle well toned. It's sad when a hobby committed to communication holds precision of expression to be stuffy. And anyone who can drop the Latin "per se" correctly into a sentence is wise enough to not misunderstand my usage of "hold."

So I guess I should have dumbed-down my assertion, perhaps saying that I reckon a ham ought to be a whole bunch more smarter about RF noise than your average hamster. And, as the OP claimed a lot of years experience, shouldn't I expect that he learned even more along the way? Is that too much to expect?

Maybe you hit the real crux of my effront when you say I "was lecturing others with an authority not recognized." So, by putting some slang and twang into my prose, can I slip under the definition of a lecture? And as to my authority, I never drag out the certificates or flash my badge. I try to speak as plainly as I can, and hope the content has the ring of truth. I

expect those I post to will be able to recognize my thoughts, judge them accordingly, and realize that I'm the smartest snot they ever met. (<g> explicitely added for the humor-impared) I'd never presume to advise on things like phase-locked loops or digital modulation, of which my knowledge is woefully deficient. OK, just this once; I've been doing RF noise (reduction, prevention and creation) for about 37 years. Go ahead, qrz me and you'll see I'm an old fart. And I always sign my comments, Mister (oh, I guess you don't do that).

On the contrary. Jesus was not required to file an itineraray, or any other documentation. You say He came to America? Fine. I don't happen to be a Mormon, so I'll reserve judgement on Moroni and the golden tablets, as well as the revelation to Joseph Smith. I do not say it was not true; I say I am not a believer.

John (the baptist) holding the Urim and Thummin
before him, reads the Golden words of the previous posts--detects the work
of "God" and begins to BELIEVE!!!!

The Bible holds "Gods" (I believe it is implied from Jesus'
words/actions--he held the same) that the "choice between good and evil" is
somehow central to all of this... and that is why Jesus did not warn the
Aztecs... but then, all those Aztec records were burnt by a radical
priest... hard telling what he said to them...

Warmest regards,
John (the baptist)

|
|
| Well, I already apologized for sounding stuffy, but I can do it again.

I'll
| probably commit that offense again some time, so I better keep my
| apologizing muscle well toned. It's sad when a hobby committed to
| communication holds precision of expression to be stuffy. And anyone who
can
| drop the Latin "per se" correctly into a sentence is wise enough to not
| misunderstand my usage of "hold."
|
| So I guess I should have dumbed-down my assertion, perhaps saying that I
| reckon a ham ought to be a whole bunch more smarter about RF noise than
your
| average hamster. And, as the OP claimed a lot of years experience,
shouldn't
| I expect that he learned even more along the way? Is that too much to
| expect?
|
| Maybe you hit the real crux of my effront when you say I "was lecturing
| others with an authority not recognized." So, by putting some slang and
| twang into my prose, can I slip under the definition of a lecture? And as
to
| my authority, I never drag out the certificates or flash my badge. I try
to
| speak as plainly as I can, and hope the content has the ring of truth. I
| expect those I post to will be able to recognize my thoughts, judge them
| accordingly, and realize that I'm the smartest snot they ever met. (<g>
| explicitely added for the humor-impared) I'd never presume to advise on
| things like phase-locked loops or digital modulation, of which my
knowledge
| is woefully deficient. OK, just this once; I've been doing RF noise
| (reduction, prevention and creation) for about 37 years. Go ahead, qrz me
| and you'll see I'm an old fart. And I always sign my comments, Mister (oh,
I
| guess you don't do that).

Hi Ian,

But the credit goes to the attributed author, John Donne (Ask not for whom the bell tolls - it tolls for thee).

OK. The allusion provided by Donne in his poem "The Ecstasy" of eye beams illustrates a concept held back then that light emanated from the eye to illuminate what was seen. Or perhaps more abstractly (given the same light did not appear during night), what we see was a function of our eye projecting its ability to see. Hence, Elizabethans (because art celebrates what was; not what is) and earlier society proposed this characteristic of the eye-beam.

This is NOT currently a commonly accepted notion of how vision works; however, if we were to proceed as if it were, then the conjugate mirror would return that beam to its source (this is the characteristic of the mirror, from Jim Kelley's link which provided this coverage). This is a conjugation of the conjugate mirror. Hence, the mirror would illuminate the eye with the eye's own beam. In a clinical sense, you would see the interior of your eye (Optometrists have a device that does this).

Returning to how vision does work, one is not going to perceive any illumination simply because the eye offers none in the first place. Further, the eye is not going to perceive any other illumination either because the conjugate mirror returns all illumination to its source. The eye is excluded of ANY illumination (as I offered in the "effluvium") and the appearance of the mirror is absolute black. There is nothing to see. Several provided this answer, but not the why (blind luck).

Now, to continue on to the reference of the "evil eye." It was also predicated on the concept of eye beams. It was thought that people could harmonize their spirits by their eye beams joining. This also introduced the jeopardy of joining your eye beams with some one sinister. This would have the effect of your possibly being mastered by "the other." So, as protection against the evil eye, you would repulse "the other" with the sign of your forefinger and little finger

held up from your fist and your fist held between you and "the other." The function of this sign was that the fork of the two fingers would entwine "the other's" eye beam before it got to your eyes. It would entwine it in a lemniscate (figure 8) winding forever between these fingers, and thus your protection against the evil eye.

We might propose that the modern solution would have been a conjugate mirror.

To cap the simplicity of the solution, the conjugate is found in the angle of reflection always being the same as the angle of coincidence (or the inverse - conjugate - of the natural angle of reflection).

For those who actually visit Jim's link, I would add that this citation further stipulates that conjugate mirrors that scientists offer for experimental verification presume that the depth of the mirror surface is greater (in wavelength dimension) than the pulse of light that will be conjugately reflected. This purpose is to perform the other properties of phase conjugation (hence the name) and leads to discussion of "reversing time" which is not meant in the sense of the classic TV program of the 60s "The Time Tunnel" (which was a pretty crummy classic - I use the term ironically).

==========

To you all.

As predicted, I appear to have stirred up a hornet's nest.

First of all, give credit to where credit is due. The simple equation is not due to me but to Oliver Heaviside, 1850 - 1925. May God rest his soul. And mine!

It applies from DC to VHF where the predominent loss is due to conductor resistance including skin effect. At higher frequencies, say above 0.5 GHz, loss in the dielectric material begins to play an important part.

The complete equation is -

Attenuation = R/2/Ro + G*Ro/2 Nepers

where G is the conductance of the dielectric, which is small for materials such as polyethylene and Teflon. And 1 Neper = 20/Ln(10) = 8.686 dB.

The Neper is the fundamental unit of transmission loss per unit length of line, familiar to transmission line engineers. It is named after Napier, a canny Scotsman who had something to do with the invention of Logarithms around the 18th Century.

Attenuation is simply the basic matched loss of a particular line, unaffected by SWR and all the other encumbrances which amateurs such as W5DXP ;o) worry about. KISS.

Incidentally, the additional-loss versus SWR curves, published in the ARRL books and copied by the RSGB, for many years, are based on an incorrect mathematical analysis. But they are near enough for practical purposes.

Not that SWR matters very much. SWR meters don't measure SWR on any line anyway. You are all being fooled. ;o) ;o) ;o)

I can still see John Donne's face from the portrait on the panelled walls of my old college hall. Unfortunately that memory is indelibly associated with cold toast.

He and others may have created the flowery English... but the credit for the flower arrangement is all yours, Richard.

I don't use the SWR meter to measure the standing wave anyway... more just to keep the finals running kewl... lucky for me there is some kind of relationship to replacing finals in high power amps and the dumb meter...

I can just lay a hand on the amp and start a conversation... adjusting match for lowest heat (or least smoke)--but the meter takes a lot of guess work out of it... I miss tubes for that very reason... you could always adjust for least red glow on the plates... <grin>

Warmest regards,
John

John,

All the so-called SWR meter tells you is whether or not the
transmitter is being loaded with 50 ohms.

This may be a useful thing to know. But it is NOT SWR. Where is the
line on which the SWR is supposed to be measured?

By the way, I think I am receiving all your emails. But you do not
appear to be receiving any of mine. Don't think I do not wish to
speak to you.

Could you check that you can receive other people's emails?

2634. Center fed Zepp VS G5RV ?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-15 10:39:35 UTC
From: Gary
Message-ID: <gr8e81dp5mkll0t725j04bkgsrupan9s4n@4ax.com>
Source record: 77198

I've got a friend that swears by a center fed Zepp antenna as great multiband antenna (2004 ARRL handbook Pg. 20.5 center column) His is cut for 80 meters but he claims great operation on other bands as well. He feeds it with 300 Ohm twin lead which then comes into his shack and is connected to choke / impedance ? matching baluns ? Initially one end of the twin lead connects to the center conductor of the "balun" which is approx 10 turns of RG-8X, in a 6" coil, the other end is connected to the braid. Then the center conductor of the first coil / balun is connected to the braid of an identical coil and the braid of the first coil is connected to the center conductor of the second coil. Then that is run through his transmatch. He said he got the idea from a now SK ham about 30 some years ago and has been using it ever since.

The handbook doesn't mention the double "coil" / balun arrangement. I wonder if anyone else has used or seen such an antenna and feedline arrangement ?

no kidding i'd think it was the other way around, shows u what i know

lucky for me my babies' stranded, gee that sounded funny

but seriously folks, thanks very much to all those that replyed,!!

seems the jest' is my clamps are ok (my GF liked those little clamps
too)

... as long as i wrap them up --i used coax seal

i guess a drop of corrosion is not fatel, at least w/all the conditins
my swr is still same 1:1 most bands

thanks all

2639. Question about Cushcraft A3S Traps.....

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-15 12:43:04 UTC
From: Sandlapper <k4nau@hotmail.com>
Message-ID: <ba6dnWFl2K5F3hrfRVn-vg@comcast.com>
Source record: 77203

I recently acquired one of these antennas that has been in the air for several years. I suspect that it was sold as an A3, then "upgraded" to A3S status by using SS hardware. the antenna was disassembled when I bought it. There are 3 trap designations according to the manual: TA, TB, TC. The TA's and the TC's are identical in appearance and there are no stamps or markings to distinguish one from the other. Is there an easy way to identify which is which? Cushcraft doesn't supply any values.
Thanks, Butch K4NAU.

That's funny, I am in the process of rehabilitating a Cushcraft R-7.
The 15M trap was busted up a bit so I got out the epoxy and the torch.
The epoxy was for the fiberglass insulator and the torch was to help
straighten out the "trombone" capacitor. Later I used the grid dip
oscillator to check the resonance point of the now rebuilt trap. Just
for grins I tested the other traps too and labelled them. I'll bet
you could use a GDO to find the resonance point of your traps. Label
them when you're done.

Reg, I didn't disagree with your equation. I disagreed with this
statement of yours:

> The number one reason for attenuation being higher is because the
> conductor diameter is smaller and, as a consequence, its resistance is
> higher.

That is simply not a true statement. #13 RG-213 wire is actually
LARGER than #18 ladder-line wire yet the coax still has the
higher matched-line loss. If your statement were true, #13 RG-213
would have lower losses than #18 ladder-line but it doesn't.

The number one reason that coax has higher matched line losses
than ladder-line is NOT primarily due to wire size. It is primarily
due to the differences in characteristic impedance, as I said earlier,
and as proved by your equation above.

If the reflected power on the line between the transmitter and
the meter equals zero:

SWR = [SQRT(Pf)+SQRT(Pr)]/[SQRT(Pf)-SQRT(Pr)]

SWR = [SQRT(Pf)+0]/[SQRT(Pf)-0] = 1:1

Note that "Zepp" is in parentheses in the Handbook indicating
the usage in that context is not entirely correct. A Zepp is
1/2WL long fed at the end with 1/4WL of parallel line. Center
feeding it results only in a 1/2WL center fed dipole, not a Zepp.
I wish the ARRL wouldn't muddy the lingo like that.

> The handbook doesn't mention the double "coil" / balun arrangement. I
> wonder if anyone else has used or seen such an antenna and feedline

If I understand what you wrote, the choke should work just as
well if it were only one coil of an equal number of turns. The
common-mode currents flow only on the outside braid of coax.

In 1992 on the occasion of Galileo's exculpation by the Roman Catholic
Church, Pope Paul II stated:
"Faith should never conflict with reason."

Clearly that statement struck a new tone in how the Church deals with
science. The Church now accepts the scientific method and a fact is a
fact even in the face of contradiction with scripture.

As far as I'm concerned the Church made right and it is as it should
be. The Anti-Evolutionists in the Bible-Belt are out of step and there
were no dinosaurs in Noah's Ark!

You kinda relate SWR meters to "time", huh? Well, I am used to being fooled by "non-existant" "things"-"values" which we plug into formulas and somehow get workable results back!!!! The "Unified Antenna Theory" will be a nice thing--when it finally gets here... so, a SWR meter which doesn't work as "mentally modeled"--hey, perfectly understandable!!!

So, not in anyway in disagreement with you, just poking a bit of fun at the way things work...

Like I say, I miss the old PA tubes--dull almost dark red glow from the plates--good to excellent... brighter almost cherry red--danger will robinson!!!!... orange'ish-red--time to buy new finals!!!!! <grin>

I am at a complete loss on the email... may have picked up some malicious email from a "fan" of mine... have worn myself out attempting to find the problem--you can count on me NOT giving up until it is fixed... I keep a seperate computer for use here--this demonstrates why...

Warmest regards,
John

As an illustrated example: Assume a parallel feedline made from #24
wire and having a characteristic impedance of 600 ohms.

What size would the wire in 50 ohm coax have to be to equal the HF
matched line loss of the #24 600 ohm line? (The wire in the coax has
to be 12 times as conductive as the wire in the parallel feedline in
order to offset the effect of Z0.)

A rough estimate indicates that the #24 600 ohm line has approximately
the same matched line loss as RG-213 with its #13 wire.

Source record: 77223

Holy shit!!! I just read this entire thread and it has rapidly deteriorated into a pile of nonsense. It's a Zepp on one band but not on another but then it's a windom no it's not yes it is why not becasue yadda yadda.

Remember this: Engineers designed the Titanic. Engineers also designed the sky bridge at the Kansas City Raddison and engineeers desigend the roof of the Hartford Civic Center. And engineers design antennas.

Just put the goddam wire up in the air, tie some kind of feedline to it, run it through the antenna tuner, tune for zereo reflected power and make contacts. All else is bullshit.

From N8WWM@arrl.net

Hey CUNT,
Wanna meet at Dayton or before? I will whip your gayboy ass like a red headed step-child. You are a punk-suck fagboy hiding behind an assumed name who dont have any balls. Come on, you lap likkin shit hunk...wanna party? I will kick your fukkin ass. You are a sissyboy faggot ILLEGAL KEYCLOWN.
Go hump your wife Dweebo faggot. You can only talk smoke...I can bring it into your life.
I think you have never opened a can of whip ass.
I volunteer to show ya how.
CUNT
Your turn, CUNT!

From N8WWM@arrl.net

You pissbag, I hope you go to Dayton. I will be wearing a sign with my call on it, front and back. Come up and introduce yourself and get a lunger hawked on your faggot ass, just like your wife pus bag twistie. I fukkin dare ya. Looks like I am gonna hafta start smokin cigars or something to generate enough flegm for all you mutant nuttsak slurpers.
By the way, have you stopped molesting hamsters yet?

From:N8WWM@arrl.net

Hey Peepeeholic:
Yes I am in Toledo. I have plenty of down home hospitality for you or ANY of the other queens in here who wish to stir up some mess.
You wanna come by and visit? I will be delighted to send you back to the MISTAKE ON THE LAKE with a thought in your mind that it was a real dumb idea.
Imagine, Peepeeholic...Imagine...You come to my place and star some junk...I put you face down and hurtin extreme, take pics of you laying there with a bumped up noggin, and post 'em to the NG. I relish you coming by. I am good in the callbook, just as I told your wife, the trainedpuppet.
Have not had this much fun since I used to go cuttin' coax and building jamming oscillators back when I was 16 yrs old.
----------�----------
From N8WWM@arrl.net

Be forewarned: I like the kinda rumbles where there are cuts and broken bones. If you have never deliberately broken someones bones, or don't have the heart to cut, be civil. I have.

> Thanks, Butch K4NAU.

You're in luck. I _just_ yesterday dropped my antennas and the tower
in preparation for a move to a new QTH. Let me run out to the patio
and check... .. . .

Assuming the left side of the display is the boom, we view one half of
each element sticking out to the right:

```
|======[ <- TA ]===[unmarked]========= Director
|
|
|=======[ <- TA ]===[ <- TC ]============ Driven
|
|
|========[ <- TA ]===[ <- TC ]============= Reflector
```

On _my_ A3S the "TA" and "TC" markings are found on applied labels
that include the orientation arrows that I depicted above.
The 2 unmarked traps have _no_ detectable markings. By elimination,
these must be the "TB" traps - i suppose.
FWIW, the outside ends of the "unmarked" and "TC" traps have tubing
that 'necks down' to receive the smaller O.D. tubing out to the ends
of the element. So, the orientation of the "unmarked" trap should
be casual to the most obvious observer. :-)

Look guy, if you are a control freak, go control freak on someone else--if you are the FCC--"sick 'em boy!"...

"Criminal Activity?" I don't even J-Walk!!!

Now, if you are talking about "pirate radio"--I have listened to pirate radio since I was a child... and yes, I still hope kids--somewhere--are still listening--provided me with uncountable hours of enjoyment... perhaps my listening was "criminal"--but guess what--I'd do it again in a hot minute (still do listen actually.)

The "numbers stations", "Radio Caroline(sp?)", "Radio Moscow", "Radio Havana Cuba", yep, listened to 'em all--even communist propaganda--don't consider myself a communist either...

Really, hold such irate puritan comments to yourself--I don't enjoy them...

Ok Cecil, thanks for the information. I was curious as I was thinking
of trying the antenna myself, but perhaps I'll stick with the good ole
G5RV.

Wunnerful. But out here in the realities of practical (God forbid)
applications of the various types of backyard feedlines there's a
persistent rumor going back decades to the effect that decent open-wire
feedlines have significantly lower dielectric losses than "ham-level"
coax under all VSWR condx. So there are conductor *and* dielectric I^2R
losses to consider in this discussion yes?

2683. Could a Balun Be Useful Here?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-16 02:37:52 UTC
From: matturn@gmail.com
Message-ID: <1116211072.678865.173460@z14g2000cwz.googlegroups.com>
Source record: 77147

I have a PC FM radio peripheral. It has a standard telescopic steel aerial that plugs into a base. This works quite well.

However, I would like to recieve some signals that are too weak for this arangement. I have an external TV yagi, but attaching it either reduces the recieved signal or increases it only slightly.

Could impedence differences be an issue here? If so, what is the likely impedence of the yagi and the peripheral?

I just love how, no matter what anyone believes, they are wrong, even if you are a christian, according to the other brands of christians.

Your superstitions, which is what all your religions really are, are quite amusing.

Replacement whips come in a VARIETY of sizes (whip diameter a connection point) and well as lengths. The more popular whip sizes:

0.100 inch (2.5 mm)
0.072 inch (1.8 mm)
0.046 inch (1.2 mm)

If you need something "right now" you can use brass rod - available through your local welding shop / welding supply store OR a well equipped hobby shop for model trains, RC planes and cars.

PCTel, here in Chicago, purchase Antenna Specialists. They sell a number of replacement whips ....
http://www.antenna.com/lm_cat/lmrpg30.html
http://www.antenna.com/lm_cat/lmrpg31.html

In Canada:
Donna Lamere
Allen Telecom Canada
1815 Ironstone Manor #12
Pickering, Ontario Canada L1W3W9
Phone: (905) 830-3474
E-mail: donna@allentelecom.on.ca

Tower Electornics also has replacement whips. Contact them with whip length desired and rod diameter for your loading coil or attachment point, etc.

Reg:

I am not after your scalp, trust me...

However, as I ready for bed, I was thinking--on the age of my coax... although some may be as new as 3 years old... most is greater than 5, and I bet the run to my 1/2 vertical is 20 years or better....

Sometime in the past, I remember reviewing data on loss in coax going up with age.... not that it would amount to an important loss... but still, it must be a measurable amount...

Oh, and strange how this all keeps touching on the matter I am constantly holding at hand... but that "skin effect"... seems like copper becomes an "impedance" at high freqs.... those little electrons in the wire just can't keep pumping the charge fast enough... seems like that old rf there is considering the ether itself (dielectric in coax) as a better choice of travel than the copper atoms...

Warmest regards,
John

| >
| ================================
|
| To you all.
|
| As predicted, I appear to have stirred up a hornet's nest.
|
| First of all, give credit to where credit is due. The simple equation
| is not due to me but to Oliver Heaviside, 1850 - 1925. May God rest
| his soul. And mine!
|
| It applies from DC to VHF where the predominent loss is due to
| conductor resistance including skin effect. At higher frequencies, say
| above 0.5 GHz, loss in the dielectric material begins to play an
| important part.
|
| The complete equation is -
|
| Attenuation = R/2/Ro + G*Ro/2 Nepers
|
| where G is the conductance of the dielectric, which is small for
| materials such as polyethylene and Teflon. And 1 Neper = 20/Ln(10) =
| 8.686 dB.
|
| The Neper is the fundamental unit of transmission loss per unit length
| of line, familiar to transmission line engineers. It is named after
| Napier, a canny Scotsman who had something to do with the invention of
| Logarithms around the 18th Century.
|
| Attenuation is simply the basic matched loss of a particular line,
| unaffected by SWR and all the other encumbrances which amateurs such
| as W5DXP ;o) worry about. KISS.
|
| Incidentally, the additional-loss versus SWR curves, published in the
| ARRL books and copied by the RSGB, for many years, are based on an
| incorrect mathematical analysis. But they are near enough for
| practical purposes.
|
| Not that SWR matters very much. SWR meters don't measure SWR on any
| line anyway. You are all being fooled. ;o) ;o) ;o)

HSV Technologies Inc is developing a "weapon that uses ultraviolet laser beams to harmlessly immobilize people and animals at a distance : the Phaser-like device uses two beams of UV radiation to ionize paths in the air along which electrical current is conducted"
http://www.hsvt.org/

Do you think the ionized path in the air could be used to carry HF currents? With strong laser beams -if they don't diverge too quickly- this would lead to "virtual" very long wire antennas easy to erect!

Fran&#65533;ois f6flt

I understand that ionized gas antennas are common in stealth aircraft designs. ie they have low RCS until the ionisation is turned on.

Try a fluorescent tube as an antenna. It does work.. I'd be concerned about the noise generated on RX though.

Using lasers? My gut feel is that the power needed to do the ionizing would be attenuated off pretty quickly. Also keep in mind that the act of ionizing the air will also serve to defocus the beam of light giving it less range again.

If you prove me wrong though I'll be most happy!

Cheers Bob VK2YQA

2693. Re: High Impedance Feedlines = Lower Loss - Why ?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-16 10:22:01 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <d69s89icp1@nwrdmz02.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 77159

I have never heard of ageing effects in copper or polyethylene - or ancient ebonite spacers even.

The very first coaxial carrier communications cable was laid in Great Britain by the Post Office, around 1937, between the cities of Manchester and Leeds. There were 4 coaxial tubes inside a lead sheath. Outer conductors = 0.375". Inner conductors = 0.1", which later became the standard. Mostly air spaced. Inner conductors were supported by ebonite disks or similar material, spaced at about 1.5". Polyethylene was still waiting to be invented. Working frequencies from 60 kHz to about 2 MHz. Repeater spacing about 5 miles.

Around 1960 I had the opportunity to test sections of this cable. As far as I could judge it was in perfect working order. Bear in mind it is possible to detect small changes in attenuation only by looping back on very long lengths. It cannot be done in the lab.

I imagine coax, with temperature expansion and contraction, very slowly 'breathes' through the ends and draws in humid atmospheric pollution. Perhaps after 50 years it may have some minute detectable effect on attenuation and appearance. Attenuation is the last parameter to fail. Far more serious things have to happen to a transmission line before loss becomes noticeable.

For example, a coax line can be almost flattened with a hammer over a length of several feet which will make a shocking mess of impedance. Yet, provided the inner and outer conductors are not in contact with each other, additional loss will be undetectable.

==========

Nothing happens to metallic copper with frequency. But copper conductors also have internal inductance in addition to conductance. Inductive reactance increases with frequency. The increase in inductive reactance begins at the centre of the conductor and drives the current outwards towards the surface or perimeter. At sufficiently high frequencies the current is forced to flow only on the conductor's skin.

The conductance of copper remains the same. But the cross-section of the conductor allowed to the current is very much reduced and so the effective resistance per unit length increases together with the inductive reactance.

It's an interesting fact that at frequencies where skin effect is fully operative, conductor inductive reactance and resistance become equal to each other. Measure one and you also know the other.

Eddie -

The smallest stainless steel rod that J. Schmidt sells is 1/8" (0.125) or
(3.175 mm) in diameter.
For a 5/8 wave antenna, the whip diameter is most likely smaller than this.
Most popular whip sizes used by antenna mfg:
0.100 inch (2.5 mm)
0.072 inch (1.8 mm)
0.046 inch (1.2 mm)

You have not mentioned the specific antenna or mfg (e.g. Larsen, Diamond,
AS, etc) that you have.

You can also visit a land mobile dealer (Motorola, GE/Ericsson. Kenwood)
that performs service work and mobile installations for local or provincial
law enforcement, fire, etc. They routinely have spare whips in their
service bay.

I should have mentioned, the Manchester-Leeds Number 1 Coaxial Cable had an impedance of 75 ohms. The impedance at which, for a given price of copper, in those far-off days, had the lowest attenuation per mile. 75 ohms has stuck as the Standard..

The distance between Manchester (then the centre of the cotton industry) and Leeds (then the centre of the woolen industry), by road, over the beautiful Lancashire and Yorkshire moors, is about 40 English miles. By correct choice of impedance the conscientious engineers of that age could have saved as much as £5,000 per mile in the price of copper, to be formed in the manufactories into copper tapes for outer coaxial conductors, and drawing copper wire from 3-ton billet-form down to exact precision-size wire through water-cooled diamond dies. It was and still is a precision manufacturing industry.

More savings occur in the distance between repeater stations. If attenuation performance requirements can be met with one fewer repeater station, the cost of a whole building, power supplies and transmission equipment can be saved.

Although communications have shifted to digital, cables still matter. But eventually optical fibers will take over the long distance communications.

Radio Amateurs, with a little money to burn, never become involved with such mundane matters. They are more interested in what they imagine the SWR meter tells them. But if that keeps them happy then so be it. I am an amateur myself. I have a call sign which sounds very nice in morse code. Why should I disillusion them?

From the IEEE Dictionary: "long-wire antenna - A wire antenna
that, by virtue of its considerable length in comparison with
the operating wavelength, provides a directional radiation
pattern."

One can observe the "directional radiation pattern" just
beginning to take effect on a one wavelength end-fed antenna.

>impedence of the yagi and the peripheral?

Yes, chances are that the steel aerial is connected at 75 ohms. Your
yagi is most likely going to be frequency specific unless you are
talking about a log periodic and calling it a yagi.

The standard external TV antenna is a Log Periodic and requires a 300
ohm connection which these days is usually adapted to a 75 ohm coax
via a small balun.

While you may already know this, I will say for clarification to those
who may not...

The Yagi is a beam typically of similar length elements which will
almost look like a rectangle when all the outside tips are connected
by a line. The log periodic will almost look like a triangle in the
same way. Each element considerably smaller and may be pointed
forward to form 'V' shaped elements.

commonly it's always be thought of as a 1 wavelength wire or longer so to
answer you 240' question @ 7 mhz it would be a longwire antenna. it would
be just under longwire status at 3.5 mhz.

ma> I have a PC FM radio peripheral. It has a standard telescopic steel
ma> aerial that plugs into a base. This works quite well.

ma> However, I would like to recieve some signals that are too weak for
ma> this arangement. I have an external TV yagi, but attaching it either
ma> reduces the recieved signal or increases it only slightly.

ma> Could impedence differences be an issue here? If so, what is the
ma> likely impedence of the yagi and the peripheral?

Hmmm, those are usually 300 ohms at the top of the mast. What comes
into the building, is it a 75 ohm coax or a 300 ohm balanced twin lead
tv cable? If it is 300 ohm there might be a noticable difference. Have
you tried a little can tv transformer? Might there be an FM trap on
the antenna system? Do you have any idea of the input Z of the radio?
It may be 50 or 150 ohms, who knows? If your antenna cable is a 75 ohm
coax you may need to adapt this to whatever input Z the radio has but
it shouldn't be as critical as the 300 ohm balanced line in my opinion.

A Windom, a true Windom, is 1/2 wavelength long and fed 37% off of one end with a SINGLE wire [not coax, not 450 ohm line, nothing but a single wire].

There is no such thing as an end fed windom.

There is an end fed 1/2 wavelength DIPOLE that can be fed with 450 ladder line or 600 ohm open wire feeders and a good balanced line tuner. It will work on the fundamental and all even harmonics.

So, a 130 foot dipole end fed with 600 or 450 line and a balanced tuner will work just fine on 80, 40, 20, and 10 meters.

Hello George,

On my first reading, I imagined that you were considering replacing the 30-foot, single-wire, vertical wire running from your tuner to a 120-foot horizontal wire with a 30-foot length of ladder line. Based on the responses so far, I wonder if I correctly understood the question.

If my understanding of your question is correct, you now have something like an inverted-L, with potentially significant radiation from the vertical portion.

Changing the single wire to ladder line would probably cancel most or all of the vertically polarized radiation and would probably do little to improve the radiation from the horizontal wire. You won't get much low-angle radiation from a horizontal antenna at 30 feet, no matter how you feed it.

It is difficult to say whether you would notice an improvement with your contemplated change. I'm inclined to think not. A better move might be to consider putting down some radials. What frequencies are involved here?

Also, as some of the responses suggest, there are divergent views on the end-fed Zepp.

Be interested to hear how others see this.

Good luck.

Chuck

Also, unless the radiator is a multiple of 1/2WL, the feedline
will radiate. Seems a radiator length of (a multiple of 1/2WL
plus 1/4WL) would be worst case for feedline radiation from
unbalanced currents.

Hi Jim,

When you are doing quotations, the first paragraph does not end with a
quote mark, that is reserved for the end of the quotation.

What's the purpose of the 1/4 wave feedline wire that isn't attached
to the antenna? Is it kinda like a 1/4 wave elevated radial hoisted
into the air?

Do you have a Two-Way commercial radio maintenance shop in your area?
If so, I'd stop by, with your loading coil in hand, and ask when if they
have a replacment whip that would work. You might be able to get one free,
but bear in mind commercial frequencies are generally just above the
amateur radio bands, so if they give you a used whip, make sure it is the
proper length for your particular loading coil.

Vince wrote:
"IOW, what length must an end fed wire be to exhibit the characteristics of a "longwire" antenna?

When operating at 7 MHz, is a 240 foot long endfed wire considered to be a longwire antenna?"

Vees, rhombics, and Beverage antennas are long wires according to Kraus. The long wire is usually 2 WL or more.

240 feet is 1.7 WL at 7 MHz which is less than 2 WL.

Best regards, Richard Harrison, KB5WZI

Hi Jim,

Bombast (unless, as in this sentence) is not capitalized. Or,
perhaps, you have an unique folio edition (which would then demand
that Creature is the correct pairing for the quotation)?

Assume the current in one wire into the 6000 ohm feedpoint is 0.1
amp and Z0 = 600 ohms. There's zero current flowing in the other
wire at the feedpoint.

The theory behind the Zepp is that there will be 1.0 amp in one
wire and 1.0 + 0.1 amp in the other wire at the transmitter. The
1/4WL section transforms the common-mode current problem from
100% at the feedpoint to about 10% at the transmitter.

> Roy Lewallen, W7EL

I'm not certain I understand the difference. I thought the only type was current and the purpose is to stop common-mode current in the feedline.

Of course, I'm new at this, so I could be wrong.

2738. Loop antenna with FC-40

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-17 05:17:27 UTC
From: brane <brane@cox.net>
Message-ID: <z7fie.24$ep.6@fed1read02>
Source record: 77101

I'm considering purchasing the Yaesu FT-40 automatic antenna tuner for my FT-857D. Does anyone know if you can use a loop antenna with this tuner? The brochure states that it will handle a random wire with a minimum length of 66 feet, but does this mean the loop must be a minimum of 66 feet also?

Since from the pictures, it looks like there is only one connection at the top of the tuner, a ceramic insulator with a wind nut (I may be wrong) how would one connect both ends of the loop antenna to the tuner?

Tony

2739. NVIS antenna question

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-17 05:37:47 UTC
From: Ed <Huckleberry_REMOVE_@bigvalley.net>
Message-ID: <Xns9658E6863375spectrumhogstarbandn@207.106.93.175>
Source record: 77102

For those of you who are very experienced on NVIS antennas, I have a question:

How would a 450ohm fed (with manual tuner) 75M dipole at 15' height compare to a standard 50ohm coax fed 75M dipole at same height? Would the open feedline method reduce 75M performance compared to the regular coax fed NVIS dipole?

Ed K7AAT

I ask this because I would find it useful to use the 75M NVIS dipole also on 40M.

Current baluns:

If you have a ferrite rod from an old am radio, this guy shows you a cheap
1:1 balun:
http://www.arising.com.au/people/Holland/Ralph/CMBalun.htm

If you already have a toroid you wish to use, just wrap it the same, a
bifilar winding, with the two starting ends hooked to your coax connector,
other two ends to your antenna.

You will want the inductive reactance of the winding to be ~4X the impedance
of the coax (or antenna) at the lowest frequency of operation. This will be
computed using the al factor from the specific toroid core you have...

This works for me... and is a simple way to remember/do it... if others
have a simplier/better way--I am sure they will comment...

Warmest regards,
John

Source record: 77107

Would the
open feedline method reduce 75M performance compared to the regular
coax
fed NVIS dipole?

Yes, slightly. But not enough to really worry about if you are
careful tuning, and use the least inductance setting. But yes,
unless the coax fed is hundreds of feet long, or thin junky
coax, usually it's the least overall loss on HF. I use fanned out
dipoles for
separate bands fed with one coax. MK

2746. Re: What Makes an "End fed wire" a "Longwire" Antenna?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-17 07:32:23 UTC
From: nm5k@wt.net
Message-ID: <1116315143.565104.302400@z14g2000cwz.googlegroups.com>
Source record: 77108

The long wire is usually 2 WL or more.

Hummm. Most sources I have state 1 WL as the
deciding length to be a longwire...But I agree, as
far as performance, 1 WL, ain't much of a longwire...
Even 2 WL is no big deal...You need several WL to
really brown the food to a crispness equal to any decent
yagi laying around...I've never really run a longwire...
But a friend did years ago...Was 500 ft on 10-15
meters...It's directive, but it's also a static magnet at
times...Sometimes he could draw quite large arcs to
ground...I'd probably stick in some kind of resister to bleed
off static...MK

Dear "John Smith"
The probability that you copied works that were not covered by copyright
is minuscule. For such a work not to be covered by copyright it would have
had to be declared in the public domain by the author or publisher.

Here is a link to the Copyright Office that provides some authoritative
information about low long copyright protection lasts:
http://www.copyright.gov/circs/circ1.html#hlc

Having expressed disdain for lawyers, it is unlikely that you are a
lawyer, whatever and whoever you are. The Patent Office lists three patent
attorneys with the name of John Smith. I doubt that you are one of them.

When you copy works that are almost surely copyrighted and provide no
attribution, you encourage persons with an interest in the works to track
you down. Not wise.

Mac N8TT

2751. Magnetic Loops

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-17 11:39:28 UTC
From: Adrian Scripca YO8SSW <benishor@gmail.com>
Message-ID: <1116329968.773828.118550@f14g2000cwb.googlegroups.com>
Source record: 77116

Hello all,

Trying to get back to haming after few years I have purchased an used FT100D. The problem is the antenna. I've been searching the net for HF antenna designs that can fit my apartment's balcony. I really don't have too much space available since the apartment is rented and I live at the 9th floor.

I read about magnetic loops and I liked G4FON's version (http://www.g4fon.net/MagLoopTwo.htm) I have about 30 meters of RG58 (4mm diameter) available and was thinking of trying his implementation. The only problem is that I can't find FT50-61 toroid around here so I'll try to feed the RF to the loop through a 1/5 coax coupling loop.

Question is : will it support all the power the FT100 delivers (100W) supposing I'll use a highvoltage cap ? Tips and tricks about magloops construction will also be appreciated.

73s de YO8SSW

P.S. : I am not a native english speaker so please excuse my possible mistakes.

> I'd like to make a 1:1 balun,

==========

Wind about a dozen turns of twin, stranded, 18 AWG,
clear-plastic-insulation, speaker cable (or similar) around a 2"
diameter ferrite ring. About 3/8" cross-section. Permeability 200 to
500.

And there you have it. Speaker cable is better than coax on both
mechanical and electrical grounds.

Reg, G4FGQ.

Blimey ! If you are not English, then you write English a darn site better
than most of us English do - apart from the odd couple of trivial spelling mis
teaks (!) it was just about perfect - well done !

Nick

I'm not familiar with the FT-40 but the SGC-230 has one connection on
top for the antenna and one connection on bottom for the ground plane.
These autotuners are unbalanced devices but some hams successfully
use them to feed balanced antennas - one balanced wire to the antenna
terminal and the other to the ground plane terminal.

450 ohm ladder-line feeding a 50 ohm load has approximately the
losses as RG-213 feeding a 50 ohm load so you would not be able
to tell the difference in performance. However, you may have
trouble matching the ladder-line at the transmitter unless you
make it 1/2 wavelength long. How long will your ladder-line be?

Well, nice of you to worry about me copying, copyrighted work and suffering
a penality, but let me worry about that... and MOST technical docs have
fallen to public domain QUICKLY--especially this stuff which was cutting
edge technology--when my grandfather was a boy...

There is also "fair use", you may want to read up on it... since the
drawing I pasted here is less than a page (much less) it OBIVIOUSLY would
fall under this--and I would be covered yet again...

Most importantly is the necessity to get facts and info into the hands
needing it, in a form which they can understand--in a manner which does not
chase them off.. something I DON'T see happening here.

Warmest regards,
John

John, the trouble is at my end, caused by my nincompoop of a
dis-service provider.

If previous experience is any guide, it will take weeks to sort it
out. When it comes to managing Windows, OE and the Internet, I'm a
mere novice.

(The most important thing about ferrite rings is their size. You
can't get a dozen turns of speaker cable on 5/8" diameter rings.)

Reg.

Hi Adrian,

If it does not, try any toroid you have.

>Question is : will it support all the power the FT100 delivers (100W
>) supposing I'll use a highvoltage cap ?

It will have to be very high voltage (more than 1000V). G4FON
describes how double sided board created capacity problems. He should
have described how to use double sided board to make a capacitor.

The real problem is a variable capacitor for tuning. It must have low
resistance. Using variable capacitors with shaft tuning are not good.
Using variable capacitors that are "trombone" style are better (which
is something you usually make for yourself) because the leads are also
the plates (low resistance).

Low resistance means 0.01 Ohm - or lower. G4FON probably does not
obtain this low resistance (does it get warm?), but the design may be
useful anyway. Build it and see, and plan to build another one better
(do not throw the first one away until you can prove #2 is better).

Lenth of feedline is yet undetermined as I have not yet considered final antenna location on my forested 2 acres, nor route of feedline. Due to foalage, I may stick with coax, anyway.....

Dear "John Smith"
Fair-use is one of the most complex parts of the law. I have studied it and applied it for more many years than you have been a poseur. It has certainly caused considerable amusement among the knowledgeable people in this group to read you suggesting that I read up on the subject.

Your pretending to practice law would only be amusing if it were not that some reading what you write might believe you. You copy. You claim it is protected under the doctrine of fair-use and yet you provide no attribution nor context that could support fair-use. That is old fashion plagiarizing.

You then start to argue that such theft is for the good of the recipient. All that can be said is that you must have had a mother, and she would be ashamed. Mac N8TT

2769. Re: High Impedance Feedlines = Lower Loss - Why ?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-17 19:01:53 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <d6df31$2j8$1@nwrdmz01.dmz.ncs.ea.ibs-infra.bt.com>
Source record: 77034

Whilst on the romantic subject of coaxial attenuation -

Attenuation is the number-one characteristic of all transmission lines. From power frequencies and upwards. Yet, quantitativly, it is the smallest parameter per mile and the most difficult to measure accurately. An innocent observer might think it is hardly worth bothering about.

It is inextricably mixed up with system economics. An exact knowledge even of the temperature coefficient of attenuation is vital to communications system design.

Around the 1950's I was involved with measurement of attenuation (and other characteristics) of the first oceanic submarine telephone cables. A transatlantic coaxial cable, 2000 miles long, has an overall attenuation at 5 MHz of around 4000 decibels. The temperature coefficient of attenuation is half of the resistance temperature coefficient of copper which is 0.4 percent per degree C. Which was well known to Oliver Heaviside around 1875.

Thus, a change in temperature on the ocean bottom of 0.1 degree results in a change of 80 dB in the signal level at the far end. Unless corrected in the repeaters (of which there were about 100) this is enough to shift signals between the thermal noise level of an amplifier and its overloaded cross-modulation level.

One of the cable factories was located in Southampton Docks. As cable came off the production machinery at about 1 mile per hour, it was coiled in giant circular concrete tanks below ground level, the same size as an 8000-ton cable-laying ship's hold. Attenuation and other measurements were made in the tanks by automatic testing equipment. The cable was then loaded onto a cable ship waiting for it in the nearby dock.

I designed a special attenuation and phase-shift tester for research purposes. It did not incorporate an SWR meter. It did incorporate a phase-locked-loop but it was not until several years later that I came by chance upon a learned paper by Gruen and discovered how a PLL really works. The equipment was all tubes. A whole mobile rack of it! The final output meter was a moving-coil instrument with a scale calibrated in 0.001 decibels. There were also home-brewed 0.001 dB stepped attenuators which I had to calibrate myself.

To determine attenuation temperature coefficients in was necessary to bring tons of ice by lorry from Billingsgate fish market in central London. One of the concrete tanks was flooded with sea water and the

ice dumped in. It took 24 hours for the temperature to stabilise. I spent much of the waiting time in a pub in Southampton Town. I never knew who organised and paid for delivery of the ice which must have been the most intricate and illegal part of the whole operation.

The data accumulated was rushed to the boffins who immediately began designing even higher frequency oceanic systems. I was rewarded with a pat on the back and told to keep my mouth shut. Politics were involved somewhere.

My tester should have eventually been installed in the Science Museum, Kensington, London. But long after the job was finished it was stolen by some unfeeling person and cannibalised for the spare parts. There was a BC221, straight-line frequency variable tuning capacitor built into it. I would have liked that for myself.

Hope you enjoyed the story. From what I remember it's mostly true. Southampton makes a change from Manchester and Leeds. The Queen Mary was berthed not far from the Cable Ship Monarch.

How do you define QUICKLY?

I don't doubt that stuff that was written when your grandfather was a
boy has become public domain, but the process is certainly not quick
now.

http://www.unc.edu/~unclng/public-d.htm may be of some assistance.
Right now, things created today fall (involuntarily) into the public
domain in 70 years AT THE MINIMUM, and that may go up if Disney buys
another extension from Congress.

Doug McLaren <dougmc@frenzy.com> wrote:

| How do you define QUICKLY?

Sorry, I meant to send this as a private email. It's also US
specific, if that's not already painfully obvious.

To make this antenna relevant, well, antennas have been well
understood by people (not me!) for many many years. I've got an ARRL
Antenna handbook from the 1950s, and it's not really that different
from the one I got from the 1990s.

The writing is different, the pictures of cars with antennas mounted
are very different (and entertaining), but the general concepts
haven't changed much at all.

In the old book, VHF and UHF are sort of an afterthought, which I
guess makes sense. But the actual antenna concepts are pretty much
the same, even though the books are like 40 years apart.

(And to make it copyright related, well, my 1950's ARRL antenna book
could have entered the public domain. It depends on if it's copyright
was renewed or not.)

Just to get a little context here. . .

Years ago when I was a little bored, I determined that the ratio of the light output from a common two cell flashlight to the entire light output of the Sun is a mere 280 dB (10^28). So if you attenuate the Sun by 280 dB you get the light of a flashlight beam. Well now, if you took that flashlight beam and attenuated it again by the same amount, then did that again, and again, 14 times altogether, you still wouldn't quite have totaled 4000 dB. It's a staggering number, incomprehensible except by some pretty abstract thinking. It's real, though. I remember reading a paper long ago about transatlantic cables, and those are the numbers they work with.

Hi to all!
I need if your help.
I have a lot of 400Hz Muirhead Servomotor-Tachometer generator mod.
15M81A,fom Mil surplus.
For 400Hz supply isn't a problem but I Don't have idea how to apply or
drive this servomotors.
This motor is supplied with a 115Vac primary plus two 13Vac control
windings, one tachometer 115 Vac primary with a secondary output.
Do you have some suggestion, scheme, application notes for use this motors
in a light CNC project?
Will be welcome application notes, schematic, literatures or URL's for
this devices..

I please you to reply by email, many thanks in advance and sorry for
bandwidht..

Ciao from Italy....

I'm not insisting in this particular angle.
In fact, this is only a starting point;
I am planning to alter the angle
and thus study many different variations of the antenna
so as to decide which is "the best".
Thank you all for your interest.

p.s.: Could you suggest a name based on its geometry?

Reg Edwards wrote:
> Whilst on the romantic subject of coaxial attenuation -

A follow on from Reg's story, is that (in submarine the cables with which I was familiar), there was another grade of cable also used, a repair cable that had about two thirds the loss of the regular cable.

It was used when repair was necessary (eg repeater failure, cable damage from anchors , earthquakes etc). It is not possible to effect a repair without cutting the original cable in order to get the cable to the surface.

The technique used on CS Monarch and the like, was to use a special grapnell that caught the cable (often after many days of steaming back and forth across the suspected cable position) and hauled it up until a pre-determine tension was reached which activated a cutter in the grapnell, which separated each end off on a separate hauling line. One was buoyed off, and the CS steamed toward the other cable end until sound cable was retrieved. It was sealed and buoyed off. They then steamed back to the other buoy and retreived the other end, again steaming until sound cable was found. Calculations were then done of depth, position, losses to find how much more cable was to be removed so that when the repair cable was inserted, the S/N into each of the affected repeaters was sufficient to allow normal operation (these were linear FDM or carrier telephone cables). (In some cases, so much cable was affected that a mix of original cable and repair cable was used.)

This operation could take several days in good weather, worse in bad seas.

Owen

PS: 4000 dB sounds a lot, but when it is stated as 40dB between repeaters it sounds more manageable.

Yep, there is the possibility of an ancient flood that may have made a mess out of the Mediterranean. I believe this may have been possible.

The one I wonder about is the Fundie account where the water had to cover the entire earth. This means that it had to cover the top of Mt Everest. That is one honkin' load of water!

Why not, Gary? There are many reasons to try different types of antennas, and the fun of making them is one reason. There might also be practical reasons too. I made an OCF dipole, in no small part because the way the trees run in my yard, the coax drop was just above my shack location. And hey - the antenna works pretty well too.

I'd go for it! Then tell us what you find out.

Not to take anything away from the idea of a mag-loop , but -
you may want to also consider using a mobile antenna, like a screwdriver
(or two).

2787. electric & magnetic fields ??

As I understand it a shielded loop (non-magnetic shield) favors the magnetic field. If I wanted to measure the difference between the 2 fields how would I measure the electric field? A loop shielded with magnetic material would probably reject both fields. The 3.5 foot loop for my old HP comparator for WWVB is totally non-magnetic.
Can I generate and transmit each field separately? If so how would I do it?
tnx

I agree with your statement, but disagree with your hypothesis.

Mike, you have to remember history. When Genesis and Gilgamesh were written the world was flat, the Americas did not exist, the East [Orient] did not exist, Mt. Everest and Russia did not exist, most likely western Europe did not exist [in the experience of the authors]. The people of the UR valley [possibly today's IRAQ] did not know that Israel, Lebanon, Greece, etc existed. Their world was very, very localized. Their written language had not yet developed.

So, a major flood, similar to the Mississippi basin flood of a few years ago, a 500 year flood [0.2% probable], would be a flood of their whole world !!!

It is generally conceded that a flood occurred in the Near East in the period of pre-history. This flood was carried in ORAL traditions in several cultures. It appears in the subsequent writings of several cultures.

So, the science community should focus on a fairly significant flood, 0.2% probable, in the near east possibly 4000 to 6000 years BCE.

Now, I ask, what has this to do with ham radio antennas?? Seems like we drifted off subject!

2790. Re: Ionized air antenna

But you see, that is exactly why I do not believe in Evolution as a "religion! I have no "faith" in it. I use the evidence at hand to come to a reasonable conclusion that it is a viable system. No faith required. That some people seem to think that belief in Evolution is a religion is simply evidence of confusion on their part!

Do some math on the amount of water required to cover the world to at least the top of Mt. Everest. Then disassociate the individual atoms from the water. Calculate the increase in the amount of Oxygen in the atmosphere and the increase that would happen if the water was broken down as you suggest.

Now keep in mind that the amount of oxygen in the atmosphere needs to be in a fairly narrow range to support our form of life - too low and we suffocate, and too high, and nasty things happen due to its oxidation effect.

Reg, G4FGQ wrote:
"A transatlantic coaxial cable, 2000 miles long, has an overall attenuation at 5 MHz of around 4000 decibels."

That sounds reasonable as it is only 2 dB per mile. A mile is 52.8 increments of 100 feet, so that would produce about 0.038 dB/100 feet.

The lowest loss 75-ohm cable I found listed in the ARRL Antenna Book table is 7/8-inch Hard-line at about 0.1 dB/100 feet at 5 MHz. For an intercontinental link, you would strive for better as Reg indicated.

One problem of cable is that it has constant loss. Every cebtimeter of length takes the same percentage loss of the remaining energy. Hence, dB/ 100 feet.

Not so with radio in free-space. Getting rid of the wires ends their attenuation. Loss is then due to decreased signal in a square unit of the wavefront caused by expansion or thinning of the signal. The "unattenuated" signal decline is 6 dB every time distance from the source doubles, be it one mile or 1000 miles. The signal power level at a point is 1/4 the power it had for the same area at 1/2 the distance from the source.

We could`not communicate by wire with our space probes due to too much loss even were the wires a practical alternative.

To cross an ocean, cable solves the problem of repeater placement. The signal must be regenerated before it falls into noise. The repeaters are "simply" integrated into the cable at proper intervals. The first transatlantic cable message was sent by Queen Victoria to the American President.

Ashore and on distant offshore platforms, I`ve puzzled why microwave was not used instead of cable. Privacy may be one reason, but encryption, route switching and other techniques could make theft of information from thin air more difficult than other theft. There are always beneficiaries of the status quo who make change difficult to impose.

In the early 1950`s, Houston`s Transcontinental Gas Pipeline Company (Ken Lay was an officer of "Transco" before moving to Enron) built a private microwave system from its heasdquarters to New Jersey along its pipeline. I recall looking the new system over. It was supplied by Philco Corporation and used Pulse Code Modulation, if I recall. The microwave system was sold to a communications common carrier (now Sprint) after a few years but it is still in service, I believe. Transco (now Williams Pipeline Company) is one of many subscribers to the service I believe.

Microwave repeaters located at about 20-mile intervals can provide low-noise and high-reliability communications when properly designed.

In the 1950`s, I marveled as I commuted to work on a stretch of road which ran between Lisbon and O`Porto, watching the Portuguese Post, Telephone, and Telegraph Company laying coaxial cable alongside.

Cable is more vulnerable to damage, harder to repair, and surely costs more than microwave. It was none of my business. I was a foreigner in their country.

Best regards, Richard Harrison, KB5WZI

Well then it would appear the antenna in question is probably a log
periodic then :-)

I will get myself a standard 75-300 ohm balun and see what I can do.

As for FM traps etc, no there's nothing like that. It's possible it's
not optimised for the FM band though, although it certainly is for
slightly higher VHF transmissions.

Correct.

> If I wanted to measure the difference between the 2 fields how would I
> measure the electric field?
Any antennna can measure the electric field, you simply have to know the
antenna factor.
Antenna factors can be calculated for various structures; for example the
aperture of a half wave dipole is given by: 0.13*lambda^2. Simple
calculations can then provide the antenna factor, and relate the E field (in
V/m) to the received signal. The electric and magnetic fields are related
by a constant -- the impedance of free space, 377 ohms. i.e. E/H = 377.
In the vicinty of an antenna (the near field) the impedance of free space
becomes a complex number.

> A loop shielded with magnetic material would probably reject both fields.
Probably true, but have never experimented with such antennas.

> The 3.5 foot loop for my old HP comparator for WWVB is totally
> non-magnetic.

> Can I generate and transmit each field separately? If so how would I do
> it?
No. The E field cannot exist without the H field. See the relationship
above. Some people claim to have invented antennas that seperately generate
E and H fields. Such antennas are known as "EH" and "Crossed-field", and
have largely been rejected by the engineering comunity as bogus. The
designers claim that they do not conform to Maxwell's Equations, but some
other indefinable mathematics.

Adrian, I would say your english usage and composition is darn near perfect. Ok now to the antenna, does your apartment have a balcony? I live in an apartment and am using a Super Antennas MP-1 (hand operated screwdriver type antenna). I do get out with it, granted there are more effective antennas than this, but it gets me on the air. I do like the idea of the loop however as I think it would be a bit less receptive to noise. Keep us posted will you please. I hope to hear you on 20M possibly sometime.

Frank
If I have two parallel plates seperated by an air space and the plates are
connect to a batttery I have a capacitor with an E field between the plates
and squeezing out the sides. In steady state there's no current flow so I
have no H field.
If I have a coil or a solenoid and connect it to a battery I have a current
flow with a strong H field but I'm not certainabout the E field.
Can this be taken to the next step to answer my original question?
tnx

Henry Kolesnik wrote:
"If I wanted to measure the difference between the two fields how would I measure the electric field?"

If this is the radiation field, not the reactive field, it would make no difference if you measured the electric field or the magnetic field, as they contain the same quantity of energy. In fact, the energy is identical as one field begets the other field. That`s "The Secret of Propagation".

That does not mean the fieldfs can`t be separated. It is easy. Enclose your loop in an effective Faraday screen. This screen prohibits electrostatic coupling to the loop, but freely allows magnetic coupling.

Faraday screens are not rare. Nearly every medium wave broadcast station uses a Faraday screen at every tower between the primary and secondary of an air-core coupling transformer. Because, without the screen, capacitive coupling to the tower would favor harmonics of the broadcast frequency over its fundamental frequency and make compliance with FCC rules difficult. The Faraday screen is also an excellent lightning protector.

It`s just as easy to allow only capacitive coupling. Simply put a circuit to be kept from magnetic coupling in an enclosure which is completely enclosed in a metal structure (sealed like an expensive signal generator except for one small hole). Use a capacitor through the small hole to couple to the outside world. Only the electric field via the capacitor will influence the circuit in the box.

R-F will not penetrate a metal shield, unless it`s special like the sliced-up Faraday screen. Then, it`s only the magnetic field which penetrates. Skin effect requires r-f to flow only on the surface of good conductors to any appreciable depth.

Best regards, Richard Harrison, KB5WZI

Henry Kolesnik wrote:
"If I have a coil or solenoid and connect it to a battery I have a current flow with a strong H field but I`m not certain about the E field."

Resistance somewhere is limiting the current. The E field accompanies the resistive voltage drop. Static fields don`t make waves. Only the rate of change makes a disturbance which propagates in waves, E&M, which generate each other.

Dear "superas_1988"
In my message of May 3, 2005, I used the name "Greek Double Rhombus."
Follows is a copy of that message. Note that comments about performance
above ground are not significant to your desire to use the antenna at 1.1
GHz.

With a few minutes of unscheduled time and a need for a bit of intellectual
stimulation that could not be provided by the sophomoric responses to the
troll's messages on the news group, I decided to investigate the antenna put
forth by one or more of our Greek attendees. Unfortunately, the original
drawing of the antenna seems to have been withdrawn.

I assumed: a "small" angle of 60 degrees, #12 AWG Cu wire, and each of
the seven wires to be 21 meters long cut into 21 segments.

The resulting antenna has a FS fundamental resonance at about 7.45 MHz
with a 1.5:1 SWR bandwidth relative to 900 ohms of about 500 kHz. The next
higher resonance occurs at about 11.27 MHz with a 1.5:1 SWR bandwidth of
about 150 kHz relative to 200 ohms.

The antenna was elevated 40 meters above perfect ground and evaluated
at 7.45 MHz. For most elevation angles, the pattern has four lobes. The
two front lobes have a minor dip between them over elevation angles from
something like 10 degrees to something like 25 degrees. Below an elevation
angle of something like 10 degrees, the mid-lobe null is pronounced. Side
nulls are excellent. Front-to-back ratio is poor.

If one wished to cover a fairly large sector at 1 Mm or so and needed a
straight-on null of a distant station, this might be a useful antenna.

I did not consider the effects of rotating the antenna 90 degrees so
that the antenna is in the X-Y plane.

Here are the FS coordinates that I used for the ends of the wires:
(X,Y,Z)
0, -10.5,0
0, 10.5,0
0, -7.687, 10.5
0, -28.687, 10.5
0, -28.687, -10.5
0, -7.687, -10.5

The wire from 0,-10.5,0 to 0, 10.5,0 was driven at its mid-point.

Good luck "superas_1988" with your investigation. Consider returning here
and telling us what you conclude about the antenna. It would be nice to
know your actual name.

Hank, and Richard, For a good explanation of this subject I always liked the book: "Introduction to Electromagnetic Fields" by Paul and Nasar. The first two chapters of mathematical review are excellent. I see barnesandnoble.com has the 3rd edition, used, for as low as $66. John D. Kraus' book; "Electromagnetics" is also a very good text.

Must politely disagree with that last part -- and probably the first part as well, at least for modern ACU (Antenna Coupling Unit) designs used in MW broadcasting.

As a condition of the FCC or other qualification needed legally to offer the tx for sale, MW broadcast transmitters must meet their harmonic suppression specs by themselves. They are not permitted to use ACU Faraday screens or other external means in doing so.

A MW ACU is optimised for maximum power transfer between the transmission line and the tower for the carrier and its sidebands, however it almost never uses coupled coils to do that. It uses T, L or Pi networks.

But with or without a Faraday screen, an ACU can couple no more harmonic energy to the radiator than exists, with respect to the carrier, at the input of the ACU -- which already meets harmonic suppression specs.

It`s true. They are type accepted and don`t produce excess harmonics at their outputs. The coupling system does not suppress the fundamental but may further suppress the harmonics.

I`m sorry to misspeak. Never the less, a capacitor`s impedance is inversely proportional to frequency. Its elimination as a coupling to the antenna eliminates a preference for higher frequencies in the coupling system. A pi or T network with shunt capacitance and series inductance favors the fundamental frequency over its harmonics. These aren`t required to meet specs but they further reduce harmonic radiation from the radio station.

The Faraday screen is common in radio stations. It was put there not to affect the antenna match but only to eliminate capacitive coupling to the antenna. It also serves as a path to earth for many antenna lightning strikes as evidenced by numerous pits and metal hrom them splashed about the enclosure.

Best regards, Richard Harrison, KB5WZI

I guess it depends on how interested they are. A good grounding in advanced calculus is certainly a prequesit for either of those texts. Even elementary calculus, combined with chapters 1 and 2, of Paul and Nasar, should be sufficient.

This must be a very dated observation. In my experience, and as confirmed to me this morning by colleagues and consultants who design such networks, MW broadcast Antenna Coupling Units commonly do not contain Faraday screens.

Lightning protection for most MW broadcast antenna systems is provided by some combination of a small inductance in series with the tower feed (copper tubing with a helical loop or two in it to connect the ACU output to the tower feedpoint), an arc gap across the tower base to ground adjusted to flash over at the lowest practical peak voltage, and a static drain choke (path with high Z for RF, but low DC resistance to ground).

Richard Hry wrote:
"---MW broadcast Antenna Coupling Units commonly do not contain Faraday screens."

My observation is from a previous century. Faraday screens were used in stations in which I worked.

My response was to the question: Can the E and H fields be separated? Yes they can, and the Faraday screen is a way to eliminate coupling the E field while coupling the H field. On the decoupled side of the shield, induced magnetic lines immediately produce electric potential differences and E fields. Little changes and nothing has been lost except for capacitive coupling between circuits on opposite sides of the Faraday screen. Breaks in the screen prevent circulating current which would generate opposition to magnetic coupling. This is demonstrated as effective since ancient times in electricity. Electric lines find a ground return in the Faraday screen and go no further.

A shield without breaks allows current circulation which generates an opposing force (Lenz`s law) and nullifies the induction. The continuous conducting screen also provides a grounded termination for the electric lines and blocks their passage too.

Capacitive coupling through a hole in a continuous shield can allow the E field to be coupled while eliminating magnetic coupling.

This does not say there is any merit to the E/H Antenna, about wehich I am ignorant.

Best regards, Richard Harrison, KB5WZI

No dispute about the nature and effectiveness of Faraday screens where appropriately used -- only about your statements that "Nearly every medium wave broadcast station uses a Faraday screen," and as to the virtual requirement that they MUST be used in MW ACUs to suppress harmonics to legal levels and to prevent lightning damage. None of that is accurate.

>groundplane-to-element spacing?

If I did everything I promised to do, I'd never get anything done.

See:
http://802.11junk.com/jeffl/pics/antennas/Biquad/index.html
I've added a VSWR and reflection coefficient graph, main page, and
NEC2 file.
http://802.11junk.com/jeffl/pics/antennas/Biquad/biqdfeed2.nec

The 300MHz frequency used is handy because everything is in
wavelengths. In this case, to get 2400MHz, just multiply everything
by 8. For example, the 288-312MHz frequency plot is actually
2304-2496MHz. If you extract dimensions from the model, it's the same
story. Multiple all dimensions that are in wavelengths by 8 to get
something useable at 2400Mhz. If you want to use the design for a
cell phone antenna or other frequency, just use a different scaling
factor.

I think the NEC2 deck I posted is the one that came with the samples
in the 4NEC2 program. (Actually, I'm not sure where it came from.)
You can download the program and sample antennas from:
http://www.si-list.org/swindex2.html#4nec2_

The frequency plot was done by changing the FR card to:
FR 0 7 0 0 288 4
This results in the plots being slightly off the ideal 300MHz
frequency. Therefore, I posted the frequency plot and main page that
was generated with the above frequency scan. There are probably
better ways to do this, but with 9 minutes per compile, I just used
what popped into my foggy brain first.

For construction details and dimensions, see:
http://martybugs.net/wireless/biquad/

The antenna to reflector spacing isn't horribly critical. The above construction article uses 15mm. I've been adjusting the height during construction for maximum gain and/or best VSWR and ending up with about 16mm (measured to center line of copper wire).

What you have could be a downed airman distress beacon/transmitter. If
so it will be transmitting on 243.0Mhz. This is a government frequency.
Be very careful with this device. If it is an ELT and you turn it on you
may receive a visit from a Civil Air Patrol Ground Search and Rescue team.

Hi all,

I want to test the PW antenna from linx technologies
(http://www.linxtechnologies.com/index.php?section=products&category=antennas&subcategory=monopole&series=pw_series)
which ends with a RG174 coax cable.

Our current enclosure is in plastic. The PCB has 6 layers and has a
ground plane of 3" by 3". Currently, we're using a PCB-mount SMA
connector. I want to test the performance of your antenna with the
current PCB. How should I attach the antenna to the PCB? If I solder
it on the PCB, how should I do it for maximum performance?

For future PCBs, what would be the most cost-effective solution? What
kind of connectors should I use? What kind of mounting would permit us
to solder it easily?

Thank you for your time.

Even bigger-effective-aperture telescope systems use very-long-
baseline interferometry to combine the signals from multiple receivers
spread out all across the planet, and even on satellites. There are
some VLBI systems using satellites in earth orbit, and I believe that
there are plans (or even systems in existence) which use satellites in
solar orbit.

The angular resolution you can get from these systems is sorta scary.

Source record: 76989

Hi Hank,

There's a nice explanation of the small loop in King, Mimno and Wing's "Transmission Lines, Antennas and Waveguides." As a receiving antenna, a loop responds to electromagnetic fields. In such fields, you can't separate the electric from the magnetic; they come as a pair. But the loop antenna, if it's properly designed, can reject locally generated electric fields which may be much stronger than their corresponding electromagnetic field which will dominate at greater distances. Consider how quckly magnetic and electric fields drop off as you increase distance from the source, and compare that with how quickly an electromagnetic field drops off. A key point about the "shielded loop" is that the shield is actually the antenna, and the gap in the shield is the feedpoint. I particularly like King's explanation of this in the ref above, but you can find it as well in other books like Johnson and Jasik.

Clearly you can generate static electric and magnetic fields independently. You can even generate a time-varying electric field which is much stronger than 377 ohms times the magnetic field you're also generating, at some particular point in space, and you can generate a time-varying magnetic field which is much stronger than 1/377th of the corresponding electric field at some particular point in space. But not very far away from those points, the dominating electric or magnetic field will have decayed to where essentially just the electromagnetic wave remains. The permittivity and permeability of the medium that field is in will determine the ratio of the magnetic and electric components: about 377 ohms in freespace.

Cheers,
Tom

Actually we do agree pretty well. My point was that the fundies who insist on literal word for work unquestioning acceptance of King James fall into silly traps on things like the flood. Your local major flood *is* probably what gave rise to the Noah's ark story.

More's the pity. It is a good story, and had stood for a long time as just that. Now we have some unusual types telling us it had to happen verbatim...

Some mag loop support high voltage like WIMO baby loop (1 kW) but they
perform not better than a rotary dipole, at best.
By not ask to install a good vertical lambda/2 cushcraft, hi-gain, gap,
hustler and co...
At least you 'ld have no problem to rotate it and sure to work the world.

God must have missed a design principle in electromagnetics. The moon is a convex surface more suited to scattering than concave which is more suited to focusing ... or is it the other way around?

Mike:

The last flood to have made a mess of the Med. Sea
happened more than 5 million years ago.
Just prior to water rushing through what is now the
Strait of Gibraltar, the Med. was a set of unconnected
salt lakes, surrounded by salt pans.

Ham:

Yes, some do say that water suddenly poured into the
Black Sea from the Med., but their numbers are shrinking.

Allow me to burden you with my standard rant on this
topic. Please, and thank you.

<engage rant mode>

Sadly, you, and maybe millions of other people,
have been misled on this subject.

Alas, there was no "Noachian" Black Sea Flood, and
the science in William Ryan's and Walter Pitman's book
"Noah's Flood: the event that changed history" has in
several cases been superceded by better information that
indicates that there was no such event, and was in most
cases preceded by evidence that indicated that there
was no such event.
Ryan and Pitman set out to overturn the orthodox view
of the history of the Black Sea, but they have apparently
abandoned their hypothesis, if more recent articles
co-authored by Ryan are any indication.
The orthodox view has prevailed, subject to some recent
modifications.

There is evidence that there was an _outflow_ southward
from the Black Sea through the Bosphorus into the
Mediterranean from more than 10000 years ago
(well before R & P's initial 5600 BCE flood date),
continuously until the present day, though there may have
been a relatively short interruption.
And evidence from the south shore of the Black sea shows
that the level of the Black Sea was only 18 m below the
present level at the time of the supposed flood.
The more recent claim by Ryan puts the flood date at
8400 BP, or about 9000 years ago, but then the
"floodwaters" through the Bosphorus channel would have been
only about 5 metres deep. 9000 years ago is when everybody
else always thought that Mediterranean saltwater first
entered the Black Sea. At about that time, the last phase
of Glacial Lake Agassiz, in central Canada, finally found
an outlet to the sea through or under the remnants of the
Laurentide Ice Sheet, and so out into the North Atlantic,
raising sea level an appreciable amount, and _perhaps_
triggering a sudden inflow of saltwater into the Black Sea
basin.
But probably not sudden or great enough to inspire a
Noachian Flood myth.
Better candidates are widespread inundation of low-lying
parts of the Persian Gulf associated with the final draining
of Glacial Lake Agassiz, and similar flooding of the Tigris-
Euphrates delta, and (most likely) simultaneous flooding of
the Tigris and Euphrates, which would have looked like a
flooding of the entire world from the viewpoint of a person
near present-day Baghdad. These candidates could each or all
have inspired the flood myth in the epic of Gilgamesh, which
predates the first known appearance of the Noachian Flood
myth.

Check this out, for a layman-friendly synopsis of the
refutation:

http://home.entouch.net/dmd/bseaflod.htm

On the draining of Glacial Lake Agassiz:

http://cgrg.geog.uvic.ca/abstracts/PerkinsOnceDuring.html

Full article:

http://www.highbeam.com/library/doc0.asp?DOCID=1G1:94334735&refid=ip_...

And here's a fairly recent news item on refutation of
Ryan's and Pitman's hypothesis:

http://www.charlotte.com/mld/observer/news/4949335.htm

<BEGIN QUOTE>
January 14, 2003

Scientists are seriously challenging a recent,
fascinating proposal that Noah's epic story --
setting sail with an ark jam-full of animal couples --
was based on an actual catastrophic flood that suddenly
filled the Black Sea 7,500 years ago, forcing people to
flee.

In a detailed new look at the rocks, sediments, currents
and seashells in and around the Black Sea, an international
research team pooh-poohs the Noah flood idea, arguing that
all the geologic, hydrologic and biologic signs are wrong.

Little that the earth can tell us seems to fit the Noah
story, they say. The new research takes direct aim at the
work of two Columbia University geologists -- William Ryan
and Walter Pitman -- whose proposal in 1997 ignited much
new interest, and much new research, into Middle East
history and geology.

<END QUOTE>

Also, Ballard did not find Noah's House, and he has
recently admitted that he didn't find any evidence of
human occupation of the Black Sea continental shelf,
let alone any support for the BSFlood hypothesis.
Here is another recent news article telling you about
that (please be warned that several statements in the
article are erroneous, e.g.
"Scholars agree the Black Sea flooded when
rising world sea levels caused the Mediterranean to
burst over land and fill the then-freshwater lake."):

"Black Sea Trip Yields No Flood Conclusions"

http://www.puresupply.com/newap/D8458SGG3.html

There was no actual ruined building found by
Ballard, but rather just a partly rectangular outline
of raised bed on the continental shelf, that might
even be the outline of the wheelhouse of a modern
freighter.
To the northwest the outline continues, and narrows
to a point.
To the southeast, the outline continues for a shorter
distance, and ends in a rounded curve.
Just what you'd expect when a sunken ship's hull is
covered with sediment.
The wood didn't necessarily contaminate the site,
it might have been part of the ship, and so accurately
dates the site.
The roughly-worked stones could have been the ship's
ballast.

If you wish, I can supply links to the writeups on
Ballard's finds in professional journals.

And here are a couple of scientific papers:

"Is the abrupt drowning of the Black Sea shelf at
7150 yr BP a myth?"

http://lava.tamu.edu/courses/geol101/herbert/docs/BlackSeaFloodCritiq...

"Persistent Holocene Outflow from the Black Sea to
the Eastern Mediterranean Contradicts Noah's Flood
Hypothesis"

http://www.geosociety.org/pubs/gsatoday/toc0205.htm

And there's lots more, but you'd need access to
scientific journals to read it, but you could ask me
for more details if you want them.
Some of the articles are available on the Web.

Sorry to splash water in the frying pan.

The memo that has "IMPEACH HIM" written all over it.

The top-level government memo marked "SECRET AND STRICTLY PERSONAL", dated eight months before Bush sent us into Iraq, following a closed meeting with the President, reads, "Military action was now seen as inevitable. Bush wanted to remove Saddam through military action justified by the conjunction of terrorism and WMD. But the intelligence and facts were being fixed around the policy."

Read that again: "The intelligence and facts were being fixed...."

For years, after each damning report on BBC TV, viewers inevitably ask me, "Isn't this grounds for impeachment?" -- vote rigging, a blind eye to terror and the bin Ladens before 9-11, and so on. Evil, stupidity and self-dealing are shameful but not impeachable. What's needed is a "high crime or misdemeanor."

And if this ain't it, nothing is.

The memo uncovered this week by the TIMES, goes on to describe an elaborate plan by George Bush and British Prime Minister Tony Blair to hoodwink the lanet into supporting an attack on Iraq knowing full well the evidence for war was a phony.

A conspiracy to commit serial fraud is, under federal law, racketeering. However, the Mob's schemes never cost so many lives. Here's more. "Bush had made up his mind to take military action. But the case was thin. Saddam was not threatening his neighbors, and his WMD capability was less than that of Libya, North Korea or Iran."

Really? But Mr. Bush told us, "Intelligence gathered by this and other governments leaves no doubt that the Iraq regime continues to possess and conceal some of the most lethal weapons ever devised."

A month ago, the Silberman-Robb Commission issued its report on WMD intelligence before the war, dismissing claims that Bush fixed the facts with this snooty, condescending conclusion written directly to the President, "After a thorough review, the Commission found no indication that the Intelligence Community distorted the evidence regarding Iraq's weapons." We now know the report was a bogus 618 pages of thick whitewash aimed to let Bush off the hook for his murderous mendacity. Read on: The invasion build-up was then set, says the memo, "beginning 30 days before the US Congressional elections." Mission accomplished. You should parse the entire memo -- reprinted below -- and see if you can make it through its three pages without losing your lunch. Now sharp readers may note they didn't see this memo, in fact, printed in the New York Times. It wasn't. Rather, it was splashed across the front pages of the

Times of LONDON on Monday.

It has effectively finished the last, sorry remnants of Tony Blair's political career. (While his Labor Party will most assuredly win the elections Thursday, Prime Minister Blair is expected, possibly within months, to be shoved overboard in favor of his Chancellor of the Exchequer, a political execution which requires only a vote of the Labour party's members in Parliament.)

But in the US, barely a word. The New York Times covers this hard evidence of Bush's fabrication of a casus belli as some "British" elections story. Apparently, our President's fraud isn't "news fit to print."

My colleagues in the UK press have skewered Blair, digging out more incriminating memos, challenging the official government factoids and fibs. But in the US press nada, bubkes, zilch. Bush fixed the facts and somehow that's a story for "over there."

The Republicans impeached Bill Clinton over his cigar and Monica's affections. And the US media could print nothing else. Now, we have the stone, cold evidence of bending intelligence to sell us on death by the thousands, and neither a Republican Congress nor what is laughably called US journalism thought it worth a second look.

My friend Daniel Ellsberg once said that what's good about the American people is that you have to lie to them. What's bad about Americans is that it's so easy to do.

[Here it is - the secret smoking gun memo
- discovered by the Times of London. - GP]

SECRET AND STRICTLY PERSONAL - UK EYES ONLY
DAVID MANNING

From: Matthew Rycroft

Date: 23 July 2002 S 195 /02

cc: Defence Secretary,Foreign Secretary, Attorney-General,
Sir Richard Wilson, John Scarlett, Francis Richards, CDS, C,
Jonathan Powell, Sally Morgan, Alastair Campbell

IRAQ: PRIME MINISTER'S MEETING, 23 JULY

Copy addressees and you met the Prime Minister on 23 July to discuss Iraq.

This record is extremely sensitive. No further copies should be made. It should be shown only to those with a genuine need to know its contents.

John Scarlett summarised the intelligence and latest JIC assessment. Saddam's regime was tough and based on extreme fear. The only way to overthrow it was likely to be by massive military action. Saddam was worried and expected an attack, probably by air and land, but he was not convinced that it would be immediate or overwhelming. His regime expected their neighbours to line up with the US. Saddam knew that regular army morale was poor. Real support for Saddam among the public was probably narrowly based.

C reported on his recent talks in Washington. There was a perceptible shift in attitude. Military action was now seen as inevitable. Bush wanted to remove Saddam, through military action, justified by the conjunction of terrorism and WMD. But the intelligence and facts were being fixed around the policy. The NSC had no patience with the UN route, and no enthusiasm for publishing material on the Iraqi regime's record. There was little discussion in Washington of the aftermath after military action.

CDS said that military planners would brief CENTCOM on 1-2 August, Rumsfeld on 3 August and Bush on 4 August.

The two broad US options were:

(a) Generated Start. A slow build-up of 250,000 US troops, a short (72 hour) air campaign, then a move up to Baghdad from the south. Lead time of 90 days (30 days preparation plus 60 days deployment to Kuwait).

(b) Running Start. Use forces already in theatre (3 x 6,000), continuous air campaign, initiated by an Iraqi casus belli. Total lead time of 60 days with the air campaign beginning even earlier. A hazardous option.

The US saw the UK (and Kuwait) as essential, with basing in Diego Garcia and Cyprus critical for either option. Turkey and other Gulf states were also important, but less vital. The three main options for UK involvement were:

(i) Basing in Diego Garcia and Cyprus, plus three SF squadrons.

(ii) As above, with maritime and air assets in addition.

(iii) As above, plus a land contribution of up to 40,000, perhaps with a discrete role in Northern Iraq entering from Turkey, tying down two Iraqi divisions.

The Defence Secretary said that the US had already begun "spikes of activity" to put pressure on the regime. No decisions had been taken, but he thought the most likely timing in US minds for military action to begin was January, with the timeline beginning 30 days before the US Congressional elections.

The Foreign Secretary said he would discuss this with Colin Powell this week. It seemed clear that Bush had made up his mind to take military action, even if the timing was not yet decided. But the case was thin. Saddam was not threatening his neighbours, and his WMD capability was less than that of Libya, North Korea or Iran. We should work up a plan

for an ultimatum to Saddam to allow back in the UN weapons inspectors. This would also help with the legal justification for the use of force.

The Attorney-General said that the desire for regime change was not a legal base for military action. There were three possible legal bases: self-defence, humanitarian intervention, or UNSC authorisation. The first and second could not be the base in this case. Relying on UNSCR 1205 of three years ago would be difficult. The situation might of course change.

The Prime Minister said that it would make a big difference politically and legally if Saddam refused to allow in the UN inspectors. Regime change and WMD were linked in the sense that it was the regime that was producing the WMD. There were different strategies for dealing with Libya and Iran. If the political context were right, people would support regime change. The two key issues were whether the military plan worked and whether we had the political strategy to give the military plan the space to work.

On the first, CDS said that we did not know yet if the US battleplan was workable. The military were continuing to ask lots of questions.

For instance, what were the consequences, if Saddam used WMD on day one, or if Baghdad did not collapse and urban warfighting began? You said that Saddam could also use his WMD on Kuwait. Or on Israel, added the Defence Secretary.

The Foreign Secretary thought the US would not go ahead with a military plan unless convinced that it was a winning strategy. On this, US and UK interests converged. But on the political strategy, there could be US/UK differences. Despite US resistance, we should explore discreetly the ultimatum. Saddam would continue to play hard-ball with the UN.

John Scarlett assessed that Saddam would allow the inspectors back in only when he thought the threat of military action was real.

The Defence Secretary said that if the Prime Minister wanted UK military involvement, he would need to decide this early. He cautioned that many in the US did not think it worth going down the ultimatum route. It would be important for the Prime Minister to set out the political context to Bush.

Conclusions:

(a) We should work on the assumption that the UK would take part in any military action. But we needed a fuller picture of US planning before we could take any firm decisions. CDS should tell the US military that we were considering a range of options.

(b) The Prime Minister would revert on the question of whether funds could be spent in preparation for this operation.

(c) CDS would send the Prime Minister full details of the proposed military campaign and possible UK contributions by the end of the week.

(d) The Foreign Secretary would send the Prime Minister the background on the UN inspectors, and discreetly work up the ultimatum to Saddam. He would also send the Prime Minister advice on the positions of countries in the region especially Turkey, and of the key EU member states.

(e) John Scarlett would send the Prime Minister a full intelligence update.

(f) We must not ignore the legal issues: the Attorney-General would consider legal advice with FCO/MOD legal advisers. (I have written separately to commissionthis follow-up work.)

how can this be??
dosn't it voilate E=mc 2??

if two particles traveling at speed of light collided with enough energy
to attempt occupying the same space , would'nt it yield E?

T

hmmm what i ponder is when you say space, if you mean like space around
galaxy's stars' solar systems or even kinda areas that seems devoid of
large stellar stuffs (as above) however particulate matter exists, what
was thought of as empty space is not truly empty, thou it's theoriezed
that their are a few areas that seem really really truly 'empty' but
who knows if a radio wave would 'propagte' there??

guess it would if the particles maintained their quantum interconnected
simutenious 'space' and time, aka demsional ''links'

in fact i am trying to build a com device that uses this, difficult
using materials here on earth, but once completed i'll wisk myself away

Negative. I worked at the "other" ELF site in WI. All the ELF antennas were above ground. Each antenna was about 13 miles long. The ELF transmitters shut down several months ago and the site equipment and antennas are being removed.

The ELF antennas in Michigan and Wisconsin were bigger than 70M. Each
was 13 miles long. Wisconsin had 2 antennas and the Michigan site had 3
antennas. The patterns were steerable electronically by changing the
current phases. Simple stuff. I used to work there.

It was called ELF (Extremely Low Frequency). Yes, lots of power but the antennas were so short compared to a wavelength at the frequencies used, and therefore pretty lossy, the ERP was about 4 Watts. But, it worked splendidly. They pulled the plug on ELF a few months ago and are dismantling it all...I used to work there in the 1990s and it was a very interesting setup. How many people worldwide can say they have ELF experience? ;)

The memo that has "IMPEACH HIM" written all over it.

The top-level government memo marked "SECRET AND STRICTLY PERSONAL", dated eight months before Bush sent us into Iraq, following a closed meeting with the President, reads, "Military action was now seen as inevitable. Bush wanted to remove Saddam through military action justified by the conjunction of terrorism and WMD. But the intelligence and facts were being fixed around the policy."

Read that again: "The intelligence and facts were being fixed...."

For years, after each damning report on BBC TV, viewers inevitably ask me, "Isn't this grounds for impeachment?" -- vote rigging, a blind eye to terror and the bin Ladens before 9-11, and so on. Evil, stupidity and self-dealing are shameful but not impeachable. What's needed is a "high crime or misdemeanor."

And if this ain't it, nothing is.

The memo uncovered this week by the TIMES, goes on to describe an elaborate plan by George Bush and British Prime Minister Tony Blair to hoodwink the lanet into supporting an attack on Iraq knowing full well the evidence for war was a phony.

A conspiracy to commit serial fraud is, under federal law, racketeering. However, the Mob's schemes never cost so many lives. Here's more. "Bush had made up his mind to take military action. But the case was thin. Saddam was not threatening his neighbors, and his WMD capability was less than that of Libya, North Korea or Iran."

Really? But Mr. Bush told us, "Intelligence gathered by this and other governments leaves no doubt that the Iraq regime continues to possess and conceal some of the most lethal weapons ever devised."

A month ago, the Silberman-Robb Commission issued its report on WMD intelligence before the war, dismissing claims that Bush fixed the facts with this snooty, condescending conclusion written directly to the President, "After a thorough review, the Commission found no indication that the Intelligence Community distorted the evidence regarding Iraq's weapons." We now know the report was a bogus 618 pages of thick whitewash aimed to let Bush off the hook for his murderous mendacity. Read on: The invasion build-up was then set, says the memo, "beginning 30 days before the US Congressional elections." Mission accomplished. You should parse the entire memo -- reprinted below -- and see if you can make it through its three pages without losing your lunch. Now sharp readers may note they didn't see this memo, in fact, printed in the New York Times. It wasn't. Rather, it was splashed across the front pages of the

Times of LONDON on Monday.

It has effectively finished the last, sorry remnants of Tony Blair's political career. (While his Labor Party will most assuredly win the elections Thursday, Prime Minister Blair is expected, possibly within months, to be shoved overboard in favor of his Chancellor of the Exchequer, a political execution which requires only a vote of the Labour party's members in Parliament.)

But in the US, barely a word. The New York Times covers this hard evidence of Bush's fabrication of a casus belli as some "British" elections story. Apparently, our President's fraud isn't "news fit to print."

My colleagues in the UK press have skewered Blair, digging out more incriminating memos, challenging the official government factoids and fibs. But in the US press nada, bubkes, zilch. Bush fixed the facts and somehow that's a story for "over there."

The Republicans impeached Bill Clinton over his cigar and Monica's affections. And the US media could print nothing else. Now, we have the stone, cold evidence of bending intelligence to sell us on death by the thousands, and neither a Republican Congress nor what is laughably called US journalism thought it worth a second look.

My friend Daniel Ellsberg once said that what's good about the American people is that you have to lie to them. What's bad about Americans is that it's so easy to do.

[Here it is - the secret smoking gun memo
- discovered by the Times of London. - GP]

SECRET AND STRICTLY PERSONAL - UK EYES ONLY
DAVID MANNING

From: Matthew Rycroft

Date: 23 July 2002 S 195 /02

cc: Defence Secretary,Foreign Secretary, Attorney-General,
Sir Richard Wilson, John Scarlett, Francis Richards, CDS, C,
Jonathan Powell, Sally Morgan, Alastair Campbell

IRAQ: PRIME MINISTER'S MEETING, 23 JULY

Copy addressees and you met the Prime Minister on 23 July to discuss Iraq.

This record is extremely sensitive. No further copies should be made. It should be shown only to those with a genuine need to know its contents.

John Scarlett summarised the intelligence and latest JIC assessment. Saddam's regime was tough and based on extreme fear. The only way to overthrow it was likely to be by massive military action. Saddam was worried and expected an attack, probably by air and land, but he was not convinced that it would be immediate or overwhelming. His regime expected their neighbours to line up with the US. Saddam knew that regular army morale was poor. Real support for Saddam among the public was probably narrowly based.

C reported on his recent talks in Washington. There was a perceptible shift in attitude. Military action was now seen as inevitable. Bush wanted to remove Saddam, through military action, justified by the conjunction of terrorism and WMD. But the intelligence and facts were being fixed around the policy. The NSC had no patience with the UN route, and no enthusiasm for publishing material on the Iraqi regime's record. There was little discussion in Washington of the aftermath after military action.

CDS said that military planners would brief CENTCOM on 1-2 August, Rumsfeld on 3 August and Bush on 4 August.

The two broad US options were:

(a) Generated Start. A slow build-up of 250,000 US troops, a short (72 hour) air campaign, then a move up to Baghdad from the south. Lead time of 90 days (30 days preparation plus 60 days deployment to Kuwait).

(b) Running Start. Use forces already in theatre (3 x 6,000), continuous air campaign, initiated by an Iraqi casus belli. Total lead time of 60 days with the air campaign beginning even earlier. A hazardous option.

The US saw the UK (and Kuwait) as essential, with basing in Diego Garcia and Cyprus critical for either option. Turkey and other Gulf states were also important, but less vital. The three main options for UK involvement were:

(i) Basing in Diego Garcia and Cyprus, plus three SF squadrons.

(ii) As above, with maritime and air assets in addition.

(iii) As above, plus a land contribution of up to 40,000, perhaps with a discrete role in Northern Iraq entering from Turkey, tying down two Iraqi divisions.

The Defence Secretary said that the US had already begun "spikes of activity" to put pressure on the regime. No decisions had been taken, but he thought the most likely timing in US minds for military action to begin was January, with the timeline beginning 30 days before the US Congressional elections.

The Foreign Secretary said he would discuss this with Colin Powell this week. It seemed clear that Bush had made up his mind to take military action, even if the timing was not yet decided. But the case was thin. Saddam was not threatening his neighbours, and his WMD capability was less than that of Libya, North Korea or Iran. We should work up a plan

for an ultimatum to Saddam to allow back in the UN weapons inspectors. This would also help with the legal justification for the use of force.

The Attorney-General said that the desire for regime change was not a legal base for military action. There were three possible legal bases: self-defence, humanitarian intervention, or UNSC authorisation. The first and second could not be the base in this case. Relying on UNSCR 1205 of three years ago would be difficult. The situation might of course change.

The Prime Minister said that it would make a big difference politically and legally if Saddam refused to allow in the UN inspectors. Regime change and WMD were linked in the sense that it was the regime that was producing the WMD. There were different strategies for dealing with Libya and Iran. If the political context were right, people would support regime change. The two key issues were whether the military plan worked and whether we had the political strategy to give the military plan the space to work.

On the first, CDS said that we did not know yet if the US battleplan was workable. The military were continuing to ask lots of questions.

For instance, what were the consequences, if Saddam used WMD on day one, or if Baghdad did not collapse and urban warfighting began? You said that Saddam could also use his WMD on Kuwait. Or on Israel, added the Defence Secretary.

The Foreign Secretary thought the US would not go ahead with a military plan unless convinced that it was a winning strategy. On this, US and UK interests converged. But on the political strategy, there could be US/UK differences. Despite US resistance, we should explore discreetly the ultimatum. Saddam would continue to play hard-ball with the UN.

John Scarlett assessed that Saddam would allow the inspectors back in only when he thought the threat of military action was real.

The Defence Secretary said that if the Prime Minister wanted UK military involvement, he would need to decide this early. He cautioned that many in the US did not think it worth going down the ultimatum route. It would be important for the Prime Minister to set out the political context to Bush.

Conclusions:

(a) We should work on the assumption that the UK would take part in any military action. But we needed a fuller picture of US planning before we could take any firm decisions. CDS should tell the US military that we were considering a range of options.

(b) The Prime Minister would revert on the question of whether funds could be spent in preparation for this operation.

(c) CDS would send the Prime Minister full details of the proposed military campaign and possible UK contributions by the end of the week.

(d) The Foreign Secretary would send the Prime Minister the background on the UN inspectors, and discreetly work up the ultimatum to Saddam. He would also send the Prime Minister advice on the positions of countries in the region especially Turkey, and of the key EU member states.

(e) John Scarlett would send the Prime Minister a full intelligence update.

(f) We must not ignore the legal issues: the Attorney-General would consider legal advice with FCO/MOD legal advisers. (I have written separately to commissionthis follow-up work.)

> objects a foot or two long; and touching a conductor five or six feet long can knock one down.

There are various descriptions of antenna, frequency, and power that
is undoubtedly due to mission changes over the years. I've seen Jim
Creek specified at a frequency as low as 18KHz with powers ranging
from hundreds of KW to 1 MW. It is hard to tell if those
specifications are for driven power or radiated power as antenna
efficiencies are decidedly lucky to break 50%.

The most recent top hat design is illustrated at:
www.aavso.org/aavso/meetings/spring05present/howe.ppt
which in a rough description is composed of 12 spans with 12 down
leads (bus fed); with the top hat dimension of one square mile. From
rough calculations, feedpoint R appears to be on the order of 2 Ohms.

You have no idea. The entire province of Nova Scotia is now a HAARP array, funded primarily by Crisis Unit 11, Radiological Survey Forces, USA. It's no problem locating their antennas - I just can't mention where their HQ is in Kentville, Annapolis Valley...pretty close to the Tim Horton's.

I cannot speak of Project X23. Nor do I wish to, for its planet-destroying capabilities are abhorrent.

"I cannot speak of Project X23. Nor do I wish to, for its planet-destroying capabilities are abhorrent."
So the test firing on the target of the planet Alderran was sucessful? :)

Where did you get the curve, and what string?

With no dimension in the path of propagation, there is no space; no
path; no curve; no ball(s), not even circles; no string - NADA except
for width and height.

There is no need to go into issues of "approaching" the speed of light
when light is already "at" the speed of light.

>> This yields a
>> picture that is infinitely tall and wide (also a product of light
>> speed and the same prediction of geometry).
>umm at what point then is infinite mass achieved?

Light was never mass in the first place, so why do we have to worry
about achieving (a gerundial verb which implies time, no time exists
either) a "point" that we are already at?

>and yes i am still trying to figure out how to go 'faster' than the
>speed of light , while never reaching at or near it

What would it bring you? Just take a step over any nearby event
horizon to find out.

> >dimension (sorta like a string w/two balls at ends the string still
> >exists
>
> Where did you get the curve, and what string?

***<< well i thought the , point above about occupying the same space..
, my understanding was that truly matter in any 1 dim can't occupy the
same space, but for example the way dimensional travel would work,
relating to 'time' travel (thou time"" dosn't exist) goes like this

your at a particular point, ''now' you wish to get to any other point(in
space) typically you travel point a to b (linear i guess)

so you have 2 points and a path in between, i visualize this as a
string with a ball or marble at each end , now reading above marble a
starts to travel conventionally down the route or string and the above
states that marble a can occupy same space as marble b?? i dunno

now if you mean , which i can also interpert above to mean, given lack
of cart coordinates, and assumption of our dim as default #3rd dim

i can then say to travel from a to b (really fast) , you simply alter
gravity thusly collapsing momently our e space aka passing another dim
and pow your not really traveling down a 'straight line ' that string
going from a to b anymore ''straight'' the two endpoints are now 'at
the same' place , you'd get their immediately

from your point of view you went instantly from a to b and ended up at
b(their was no 'space' inbetween so you didn't really travel along the
string you went from marble to marble ,

t might appear that the a nd b point occupy the same space but a didn't
really meld into b as it's no longer at the same space it is b space
at a 'new time' and if time is different then the 'space' must be

wich i believe is the fasted , and only way to travel since your 'time'
would be instant handy when going say a distance measured in
lightyears

if iwas smart i'd remember that theory properly but as you can see i
am only playing w/2 marbles

*yes i know 'time' dosn't exist , and yes i know their is nosuch thing
as a straight"" line, dam gravity warping everything by 'straight' i
just mean a near straigh aka shortest distance path

>
> It can't ...

But it appears to be nonetheless. Quantum Physics is not logical
but makes extremely accurate predictions.

From "QED", by Feynman: "So now, I present to you the three basic
actions, from which all the phenomena of light and electrons arise.
- Action #1: A photon goes from place to place.
- Action #2: An electron goes from place to place.
- Action #3: An electron emits or absorbs a photon."

Feynman describes the free electron in a lithium atom: "- the third
electron is farther away from the nucleus than the other two ... and
exchanges fewer photons (with the nucleus). This causes the electron
to easily break away from its own nucleus under the influence of
photons from other atoms." This "breaking away from its own nucleus"
describes the action and reaction of free electrons in metals such as
aluminum and copper.

A lithium atom has one free electron. That free electron is capable
of emitting or absorbing photons of any frequency including ham
frequencies. A helium atom has no free electrons and therefore can
emit only photons of frequencies associated with discrete orbits.

Like aether, the original definition was wrong. Black holes
exist but they leak radiation and therefore are not truly black.
Apparently, without a fresh supply of matter, a black hole will
leak radiation and eventually fade away.

"please note: the word HAARP has been judiciously inserted in this article at the discretion of the webmaster, Prissy" quote within the article suggesting that the original subject was something entirely different. Also note that the word "antenna" does not appear even in the doctored article. This particular operation is a cover for the collection of beer cans throughout Central Alaska for the impending Centennial of Alaska being made a territory (2016). It is hoped that the final project will contain as much as 56% of the estimated 4 billion beer cans imported into Alaska since 1941.

Here a similar (web)site for NAA:

http://web.elastic.org/~fche/mirrors/cryptome.org/cutler-eyeball.htm

In the last image the shadows cast by the towers are easily visible.

I'm sure I've mentioned this before but our radio club once had a
speaker who was a Navy Reservist who did a summer tour at NAA. He had
a slide show that was really interesting.

Of particular interst to me was the fact that (at that time anyway)
the top hat was "spring loaded" and allowed to move about under
ice/wind loading. The "springs" were massive concrete block weights
that rode up and down inclined tracks on the outer ring of towers.

One other interesting thing was that when they used FSK, the antenna
was retuned between mark and space.

You are correct, although how you found out about Project X24 baffles me. I
hope you do not have access to information about the nuclear thrusters at
the lunar base.

X23 is in a Lagrangian spot, and uses a combination of tungsten rods as
free-fall weapons, a second-phase cobalt bomb, and finally it bursts a
nuclear fission weapon inside itself to target Moscow. Hence, Putin becomes
Poutine.

Hi,

I have to test this propagation pgm from NAVY
"Advanced Refractive Effects Prediction System - AREPS"
available for free at http://sunspot.spawar.navy.mil/

I don't know it.

Do you know how it performs ? Or its drawback(s) or any feature I had to
check closer ?
Any review or comment is welcome to get an idea of where I put my feet ;-)

Thanks in advance

>***<< well i thought the , point above about occupying the same space..
>, my understanding was that truly matter in any 1 dim can't occupy the
>same space,

If there's only one dimension (called a Quantum Dot), then there is no
"Space" to talk about. A marble cannot exist at a point. It is like
saying Moby Dick inhabits your watch pocket (OK so perhaps this is
your favorite line in a mixers bar - if we follow that path, someone
is going to drop their marbles).

>but for example the way dimensional travel would work,
>relating to 'time' travel (thou time"" dosn't exist) goes like this
>
>your at a particular point, ''now' you wish to get to any other point(in
>space) typically you travel point a to b (linear i guess)

Wrong guess.

>so you have 2 points and a path in between

Not if we are talking about light or radiation of any frequency.
There are no paths, no points, unless what is being discussed is NOT
light.

True, you can stand at a point and aim your flashlight at another
point and there "seems" to be a path along which it is shining. These
are all figments of your perception and wholly divorced from what is
going on with the light (or other radiation).

>, i visualize this as a string with a ball or marble at each end

This is also your problem. A simple substitution could as easily
confuse the presentation if you substitute fish for marble 1 and ocean
for marble 2.

>, now reading above marble a
>starts to travel conventionally down the route or string and the above
>states that marble a can occupy same space as marble b?? i dunno

Can a fish occupy the same space as the ocean?

>now if you mean , which i can also interpert above to mean, given lack
>of cart coordinates, and assumption of our dim as default #3rd dim

It seems to me if I say the ocean is 20 feet west of me at coordinates
x,y,z degrees and the fish is also 20 feet west of me at coordinates

x,y,z degrees I can fully expect if I drop a fishing line 20 feet west of me at coordinates x,y,z degrees that I stand a chance of the fish being hooked.

However, all this is a fish story - and so are the marbles.

>i can then say to travel from a to b (really fast) , you simply alter
>gravity thusly collapsing momently our e space aka passing another dim
>and pow your not really traveling down a 'straight line ' that string
>going from a to b anymore ''straight'' the two endpoints are now 'at
>the same' place , you'd get their immediately

There are so many things wrong with this. How can "you" tell the string is not a 'straight line?' If "you" can tell, then "you" are not traveling on that line.

>you think hawking is upset,?? what about hollywood they have millions
>of unsold copies of The blackhole

It was a mediocre movie from Disney anyway. Try the "13th Floor" instead.

I've just deleted all messages, past and present, now unretrievable,
from all newsgroups, including this one.

The best antenna I've ever had is an 18-gauge, enamelled wire, going
from the kitchen window, up to a pole on the house chimney, and then
horizontal to a pole at the other end of the overgrown-with-weeds back
garden.

It is unbeatable.

To yammyr6:
Thanks for your suggestions,
but the geometry of the antenna has been approved
by my teacher and supervisor of my project,
and cannot be changed at that point.
Although, I will suggest that this altered antenna you are proposing
be studied by a colleague of mine as the next project of our antenna
lab.
I hope that it will be the evolution of my work...

I have read your message,
no need to post it again.
I suppose you did so
because I kept asking all of you
to suggest a name for the antenna.
Sorry, I know you already suggested one!

In your message you wrote:

"Note that comments about performance above ground
are not significant to your desire to use the antenna at 1.1 GHz."

When did I say it is my desire to use the antenna at 1.1 GHz???

As for my name,
I won't keep it hidden any more
as I have been very welcome by all of you to this newsgroup!
My actual name is Nick Kalantzis.

Thanks for the references, but you have som incorrect attributions in
the post.

For the argument I simply stated that such a flood was a possibility.
I'm aware that opinion is starting to run against that theory.

But you have to admit that it is still more plausable than th e
idea of of a 40 day rainfall that raises sea level at least 29,035+ feet.

I'm not subtracting the amount that tectonic forces have raised Everest
due to not knowing exactly *when* the great flood occured, if the
current rate of upthrust was maintained in that time, and also if
erosion rates have remained the same or not. But if the flood was 3000
years ago (keeping in mind that many fundies allow no greater age than
4004 bce) we could have the mountain some 98.5 feet less in altitude at
the peak at 0.394 inch per year upthrust.

Karl Rove - a close personal friend - told me about the baffles. Condi later
confirmed it when I had dinner with her in Venice.

I live in Maine, very close to Andrew Toppan. Just use his postal address
when dropping the JDAM's.

For sure that any ELF system, due to the wavelengths used will be always
very loo-ong and the longest system.
In this context we can also speak about HFGW and space VLBI.
But speaking in term of HF and microwaves, Arecibo and DSN remains the
largest.
All depend on what frequency bands are concerned.

Dear Mr. Nick Kalantzis:
It is so much nicer with names.
As you concluded, I did not know that you had read my message of the
third of May. That is why I sent it again.
You asked about the 1 GHz observation: I remember some one from Greece
indicating that the antenna was to be used at 1111 MHz. It might have been
"Dimitris." What frequency range is of interest?

We look for reports on your work. Good luck. 73 Mac N8TT

Project Sanguine was the prototype built in the 50s or 60s in Clam Lake,
WI. Mothballed after the test transmitter was built. When the project
was rekindled in the 1980s, it was simply called Project ELF.

Ham Op:

Yes, it is... mostly, people who are NOT gifted in explanations that the "layman" can understand--gravitate to such extreme mathematics (and turn them off, effectively silencing them).... let me give you my views...

... it is somewhat obvious that when a wave sent forth from our antennas encounters a metallic object that is close to resonate freq, and a very good to EXCELLENT conductor, that a LARGE current flows in the metallic structure encountered--what E and what H wave are then products are debatable (the energy absorbed is re-radiated)--however--probably of a very different nature than that of wave which encountered the metallic object in question--and here is where this debate is ongoing... at an extreme is a "tesla coil", ultimate voltage and virtually NO current (very minimal current to generate the nice purple coronas)--yet an excellent transmitting "antenna"--and that is ALL "E-wave." (well, mostly...)

Warmest regards,
John

Hawking Radiation
Electron-positron pair production happens all the time.
If a pair is produced near the event horizon of a black hole and one of the two falls in, the other escaps as radiation.

I thought that my explanations were very non-mathematical, requiring only minimal use of very simple calculations. My response was not complete as I did not want to go overboard, but try to give very easy examples that could be expanded on if any interest was shown. Perhaps you could be more specific as to where I went wrong in my response. My mention of a couple of textbooks was only to provide references for those interested in trying to understand concepts in more detail. While it is true that some people are capable of rigorous mathematical analysis, they cannot explain it in non-mathematical terms. Those people, then, do not really understand their subject. It is also true that such complex subjects cannot be fully understood without in-depth math (Which is something I wish I had).
.
> ... it is somewhat obvious that when a wave sent forth from our antennas

Not sure that resonance is important.
> and a very good to EXCELLENT conductor, that a LARGE current flows in the

Current will flow in the surface.

> what E and what H wave are then products are debatable (the energy
> absorbed is re-radiated)--however--probably of a very different nature
> than that of wave which encountered the metallic object in question--and
> here is where this debate is ongoing...

If the conducting surface is perfect, no absorbtion takes place. The reflected EM wave is planar, and identical to the incident plane wave -- with the exception of direction of propagation, and a phase reversal. A (spatial) standing wave pattern is set up, and the analysis is identical to that of a shorted transmission line.

> at an extreme is a "tesla coil", ultimate voltage and virtually NO current
> (very minimal current to generate the nice purple coronas)--yet an
> excellent transmitting "antenna"--and that is ALL "E-wave." (well,
> mostly...)

A Tesla coil is not an antenna, although some radiation will take place from its conductors -- which will probably be damped sinusoidal pulses similar to a spark transmitter. The radiation will not be all "E", but will have the same E/H ratio of any radiated signal. i.e. E/H = 377 (ohms) in the far field.

73,

Frank

Just checked http://home.wtal.de/herbs_teslapage/theory.html The Tesla coil is a spark transmitter without an antenna connected.

Surely the use of Poutine as a weapon is prohibited by some
international convention! I do know that getting it into
the US would require a sophisticated smuggling operation.

Doug:

I NEVER want to copy whole books, I can't see a reason for copying whole chapters, seldom would there be a need for whole pages--usually short of a page would suffice--this would fall under "fair use", if proper credit is give author/material... not only that, but take where I gave a URL, I could just have easily digested the info, transformed it into my own words and dumped it here--a little more work--but would only take me minutes longer--literally!!! When give the choice--I gave the man credit for where I had found it...

But, make no mistake, I am not here for "hero worship." However, if you don't think I have gotten to here without having stood upon the shoulders of others--you are mistaken--and I DO NOT make that mistake--all my very little and humble learnings have come from other men or women (hell, maybe aliens! <grin>)--I would suppose, so has yours--unless you are psychic and getting it "directly from God."

I could be mistaken, but I think I remember reading articles by Roy Lewellan when I was much younger--my memory is already not as good as once--but I would swear I seen papers/articles, etc from him when I was a teenager--that knowledge has severed me well--as well as I can remember...

I am not here to claim other mens knowledge as "original ideas" of my own--rather my whole knowledge is composed of bits and pieces of others--isn't yours?

At this point, it would be impossible to tell what bit or what piece has come from who--or when... but I will do the best I can here... someway we will find a way for this to work...

Warmest regards,
John

No, no leg pulling, toroids can be lossy (and, as we all know, more often than not--loss = heat)... I find a 2-50 Mhz balun to be more of a "myth" than a reality... even if I wind it out of the "proper" core material to begin with.... (often it is just what I have on hand <grin>)

I warned ya, my motto really is, "What ever works!!!".... I just failed to add... "...even if it is lossy!" Proper core material is important--never had one "crack" as I have heard about though...

You stated that most technical docs fall out of copyright quickly. I asked how you defined quickly, since technical docs don't fall out of copyright now any faster than anything else. (And they didn't before either, though it's possible that copyrights were not renewed more often for technical docs.)

As for facts and ideas, neither are copyrightable. Books are. If you learn something from a book, the knowledge is yours, not covered by the copyright by the book. (It may be covered by a patent, or a small phrase you learn may be trademarked, but that's different.)

| But, make no mistake, I am not here for "hero worship." However, if you
| don't think I have gotten to here without having stood upon the shoulders of
| others--you are mistaken--and I DO NOT make that mistake

What are you talking about? Obviously, all of civilization is based on what our ancestors learned. If we were each starting out fresh every generation, we'd be just another animal, and even they pass knowledge down from generation to generation (like how to hunt, etc.)

But none of this has anything to do with copyrights. I never said you had or had not violated any copyrights. Fair use is another issue that I did not touch.

| I am not here to claim other mens knowledge as "original ideas" of my
| own--rather my whole knowledge is composed of bits and pieces of
| others--isn't yours?

The majority of my knowledge is, perhaps. Not all of it. I suspect you've learned a few things on your own too.

For example, to make this antenna related, I've learned, on my own, that if your SWR meter is pegging, and your transmitter is only putting out one watt of power (when it's capable of 100 watts) that one thing to check is that all your connectors are tight. I'm sure that somebody figured this out before me, but I did learn it on my own, as I was trying to figure out what the hell was wrong with my radio :) (I'm also lucky I didn't let out any magic smoke, but that's probably because somebody learned before me that if they don't make

the transmitter back off when the SWR goes high, the magic smoke escapes and that's best avoided.)

> At this point, it would be impossible to tell what bit or what piece
> has come from who--or when... but I will do the best I can
> here... someway we will find a way for this to work...

I wasn't talking about bits of knowledge. I was talking about books, or parts of a book, or diagrams, schematics, etc. These are all covered by copyrights, though many have expired, and smaller parts of a larger work may be usable under fair use.

As a society, there is some benefit to having things protected by copyright (and patents, but they're different), as it can help provide an incentive for people to create things. But I suspect that our current society has gone too far, with Disney buying extensions from Congress every few decades, just in time to keep Mickey Mouse from becoming public domain. I do believe that we've already found a way to make it work, but the beaurocrats are finding ways to keep it from working for everybody, and instead keep it working for them.

Message-ID: <x4eje.22345$PK6.10703999@news.sisna.com>
Source record: 76948

Shield the coil, the coronas effect is still as powerful on florescents,
vtvms detecting voltage... that voltage may well be inducing a magnetic
field as it is conducted by air/ether/ground... but it looks to me like the
voltage is the main force... rfi will tear up a neighborhood too...

Warmest regards,
John

I would say over 50% of all technical books since 1950 are expired
copyright...

But, the thread which dealt with copyright, here, contains enough info to be
able to research any book you might choose... can be done in a matter of
minutes...

Easier to research any given book than argue it... and that was the point
of that thread...

I havent looked at John Kraus's(sp?) works.... the university may have
picked up his copyrights...

Warmest regards,
John

... just realized...

I got this post mixed up with an email converstation I was engaged in at the same time... sorry about the reference to "John Kraus"... that was part of another conversation...

Warmest regards,
John

Interesting you should say that, Wife had a meeting tonight and supper was
to be catch as catch can. She got home a bit early and put a stew together.
I contributed a batch of cornbread. The combination was gooooood!

Not really a major problem. The Akwesasne Mohawk reservation straddles the border - almost 15,000 acres in NY, and about 7,400 acres in Canada. Not sure about the Canadian piece, but the US part of the reservation is not even federal or state land. About the only way the American and Canadian authorities can try to interdict smuggling is to patrol the St. Lawrence River. Of course, at night in February, intercepting unlit snowmobiles on the ice and snow is not easy.

Generally speaking, I believe that they do not smuggle poutine - it's mostly cigarettes and firearms.

Incidentally, I should have said fusion, not fission. Once the M4A5 RLTD (Russian Leader Targeting Device) rapidly acquires Vladimir, the graser will supply him with enough rems to boil his gonads. Since he is rather a cheesy fellow, and as a Russian must consume potatos, and may not bathe often, instant Poutine !!

AHS

Thank you for all your remarks and comments. Of course I will try to keep you inform about my project. I feel that I owe an apology again for my late responses. However, examinations are about to begin and that's why I struggle to find a bit more time for my "internnet communication". Therefore, because of the exams, I already have given up a little bit the whole "antenna project".

However, in a couple of weeks, I'll resume my work on the antenna project, which actually I baptized D-Dimond1 (is it catchy?), and I would like to continue my communication with you in a more systematic and responsible way.

Terribly Off topic but seeing the radio connection I have to tell of the troops in Iraq using those little radio-controlled model cars as a form of IED detection. The system involves running the car into a suspected device and if the hit moves the object it isn't a bomb. If it doesn't move it is suspect. At night they tape a flashlight on the car. Ingenious, eh? http://www.defensetech.org/archives/001556.html

Since I have never had experience with a Tesla coil, this is all relatively new to me. After a little research I found the following information, which may be of interest.
